# Increased ozone pollution episodes in North China (NC)

From 2014 to 2017:

- More frequent episodes
- Higher O<sub>3</sub> concentrations
- Longer persistence

## Definition of ozone pollution episodes

- Observed MDA8 O<sub>3</sub> concentrations averaged over North China (36.5°-40.5°N, 114.5°-119.5°E) larger than 80 ppbv
- Persistence of over 5 days

Possible reasons **Local**

- More favorable weather conditions
- Higher O<sub>3</sub> chemical production (due to changes in emissions)
- Decreased PM<sub>2.5</sub> (Li et al., 2019, PNAS)

**Effect of O<sub>3</sub> transports?**

# Data and methods

## Data and model

- National air quality monitoring network of China
- MERRA2 reanalyzed data of 0.5x0.625 in Asia Region
- GEOS-Chem, tagged O<sub>3</sub> global simulation
- GEOS-Chem, tropchem nested AS simulation

MEIC inventory  
over 2014-2017

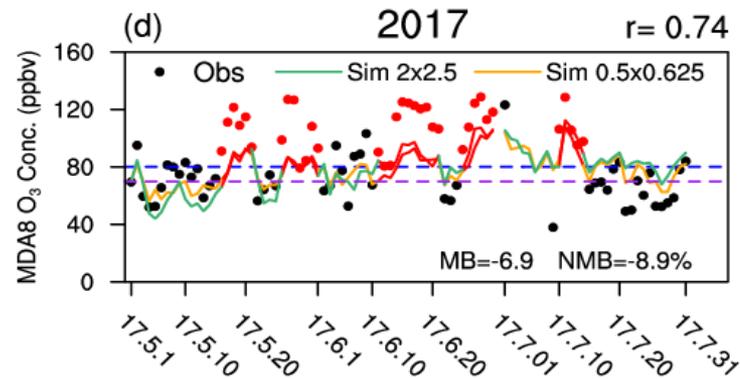

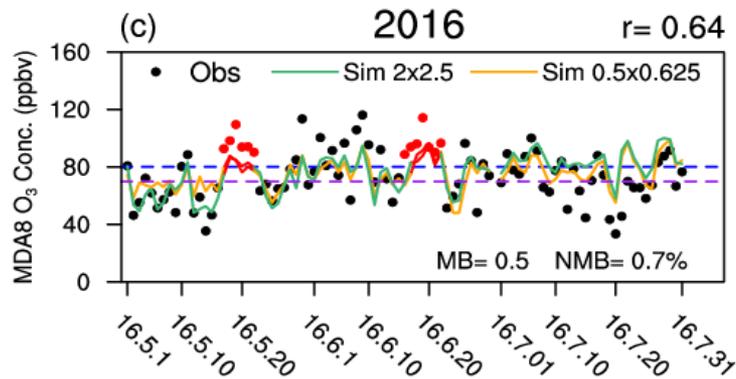

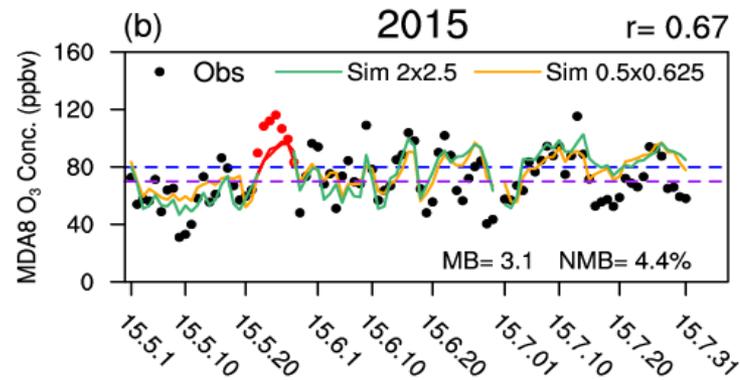

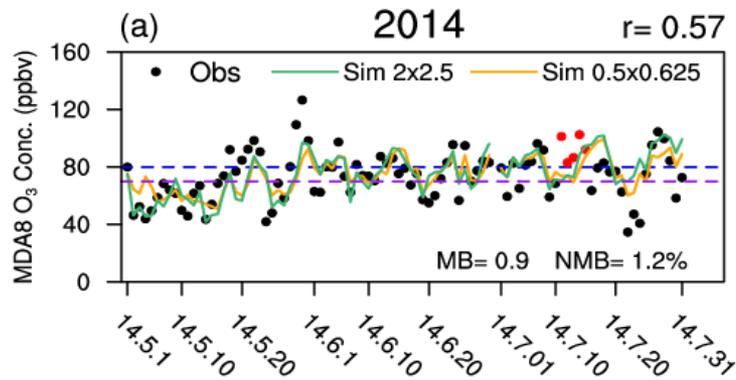

## Methods

- Composite analysis
- Backward trajectory
- Tagged O<sub>3</sub> simulations
- Sensitivity experiments

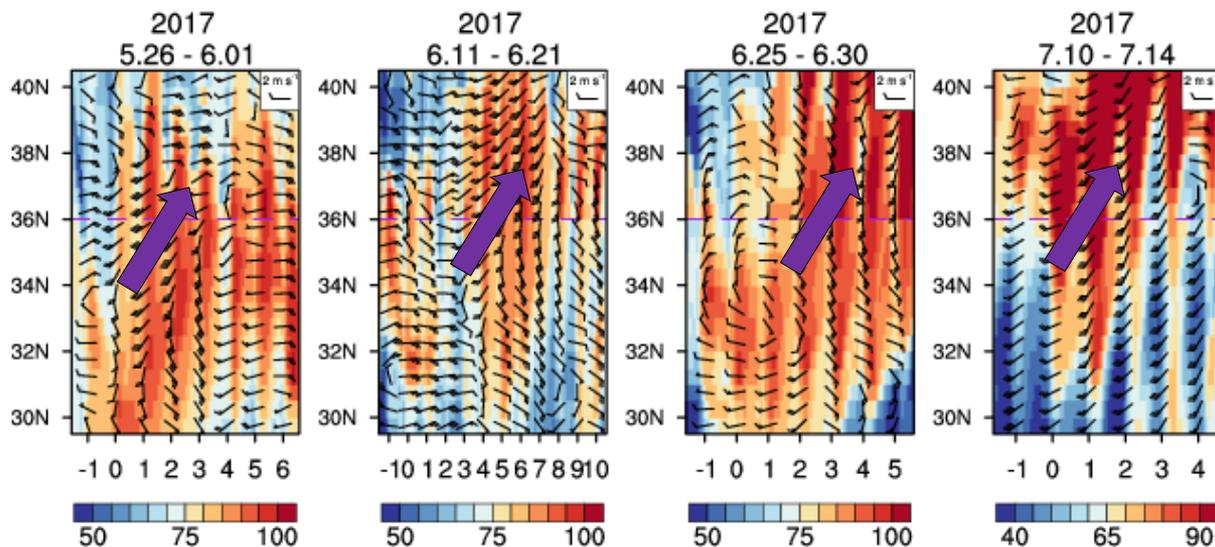

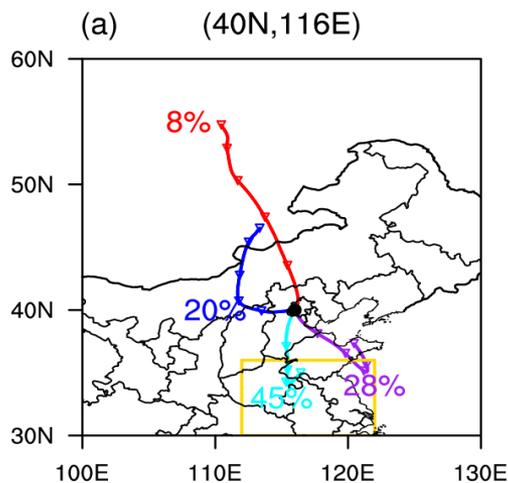

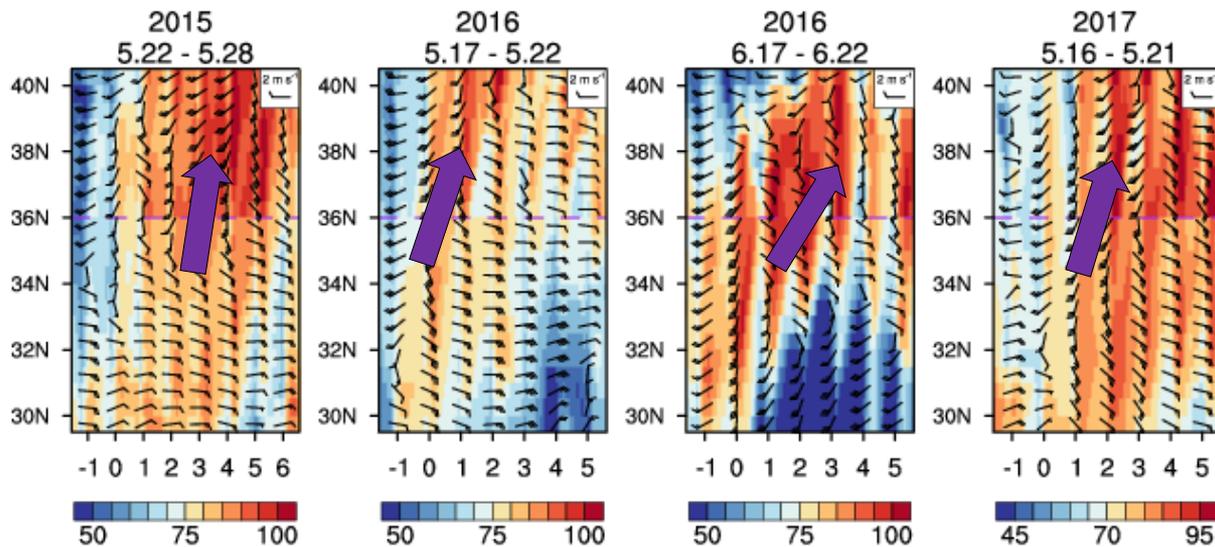

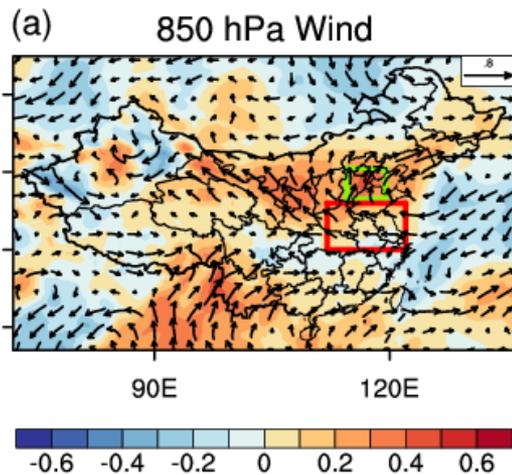

- Anomalous winds during the episodes
- Where the air comes from
- Quantifying the contributions of O<sub>3</sub> from other regions
- Evaluating effects of emission reduction on the episodes

# Model evaluation

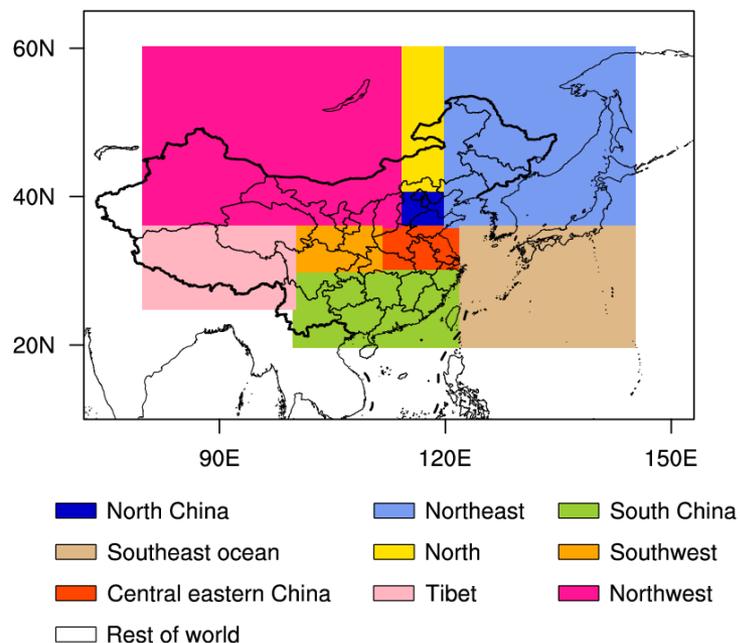

- Model underestimates O<sub>3</sub> concentrations during episodes
- Reduced threshold (69.8 ppbv, 80\*NMB) is applied in the model
- 8 of 9 episodes can be captured

# Southerlies transport ozone from central eastern China (CEC) during the episodes in NC

# Tagged O<sub>3</sub> simulation shows enhanced contribution of O<sub>3</sub> from CEC during the episodes in NC

	Total	North China	Central eastern China
Episodes (ppbv)	69.1	53.4	8.7
Seasonal mean (ppbv)	58.6	46.6	5.0
Enhancement (ppbv)	<b>10.5</b>	<b>6.8</b>	<b>3.7</b>

Compared with the seasonal mean, O<sub>3</sub> concentrations are enhanced by 10.5 ppbv during the episodes, in which about 1/3 O<sub>3</sub> are caused by transport from central eastern China.

	North China	North east	South China	Southeast ocean	North	South west	Central eastern China	Tibet	North west	Rest of world
Episodes (%)	76.80	3.46	0.02	0.08	0.84	0.06	13.00	0.01	5.34	0.39
Seasonal mean (%)	79.49	4.06	0.03	0.14	1.73	0.05	7.62	0.02	5.82	1.05

# Transport from CEC leads to the increased ozone pollution episodes in North China

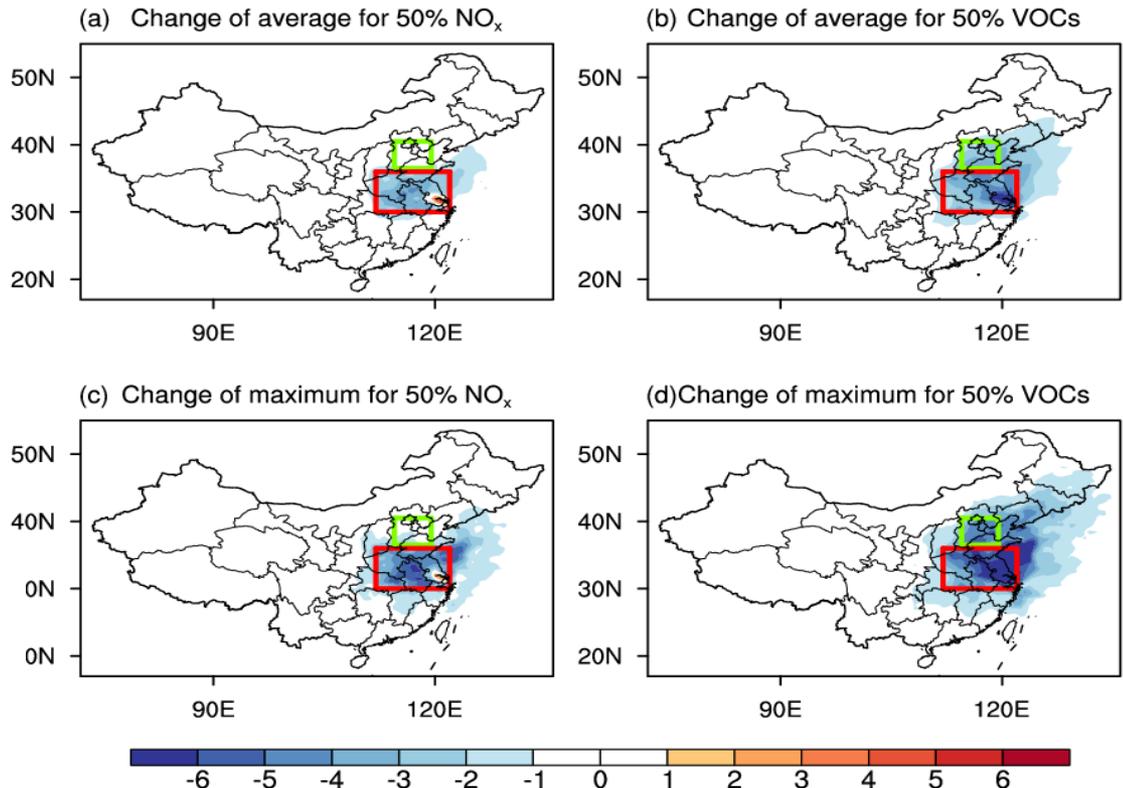

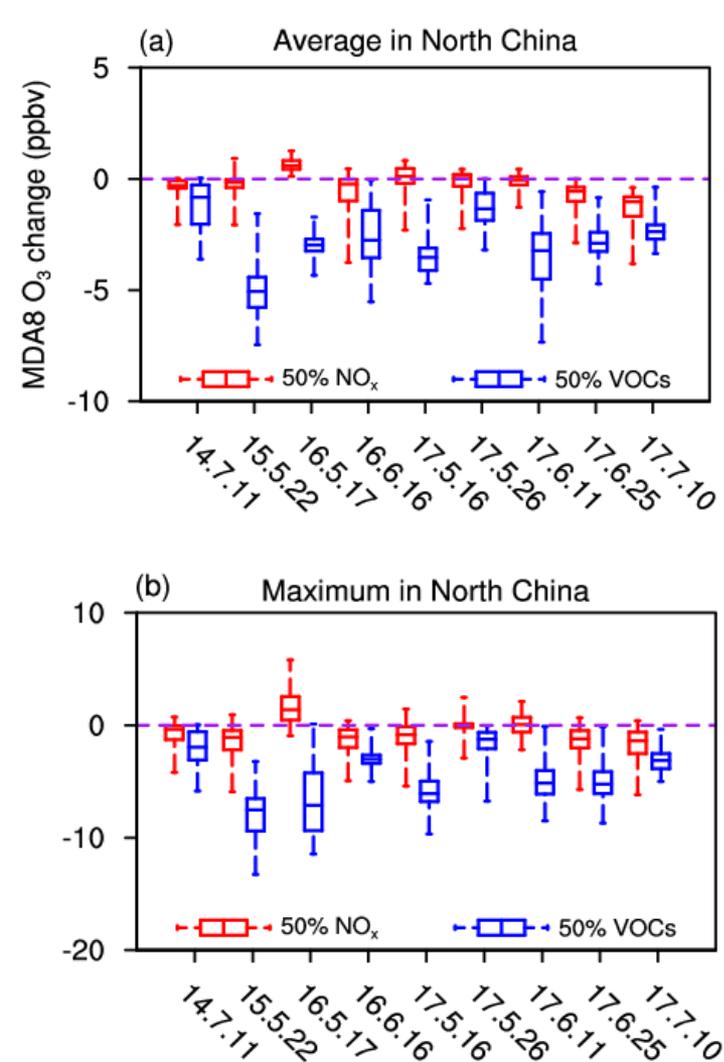

- Higher O<sub>3</sub> concentrations in central eastern China
- Stronger meridional winds in the lower atmosphere

Stronger ozone transports

Increase of ozone pollution episodes

# Reductions in VOCs in CEC help to reduce peak O<sub>3</sub> concentrations of the episodes in NC

- Reductions in VOCs in central eastern China are more efficient than reductions in NO<sub>x</sub>
- Emission reductions in central eastern China are helpful for reducing the peak O<sub>3</sub> concentrations during episodes in North China

# Summary

- We highlight the importance of the regional transport from central eastern China to the occurrence of ozone pollution episodes in North China.
- **O<sub>3</sub> transport from central eastern China can contribute 1/3 to the O<sub>3</sub> enhancement** during episodes compared with the rest 2/3 contributed by local chemical production.
- **The transport of O<sub>3</sub> from CEC is increasing, which leads to the increases in observed O<sub>3</sub> pollution episodes in NC.**
- Sensitivity experiments reveal that the **reductions in VOCs in central eastern China are efficient to alleviate O<sub>3</sub> pollution episodes in North China, especially for the peak O<sub>3</sub> concentrations.**
