

# **Becoming a Group:**

How Changing National Demographics Will  
Shape White Identity and Intergroup Relations

Eric D. Knowles  
New York University

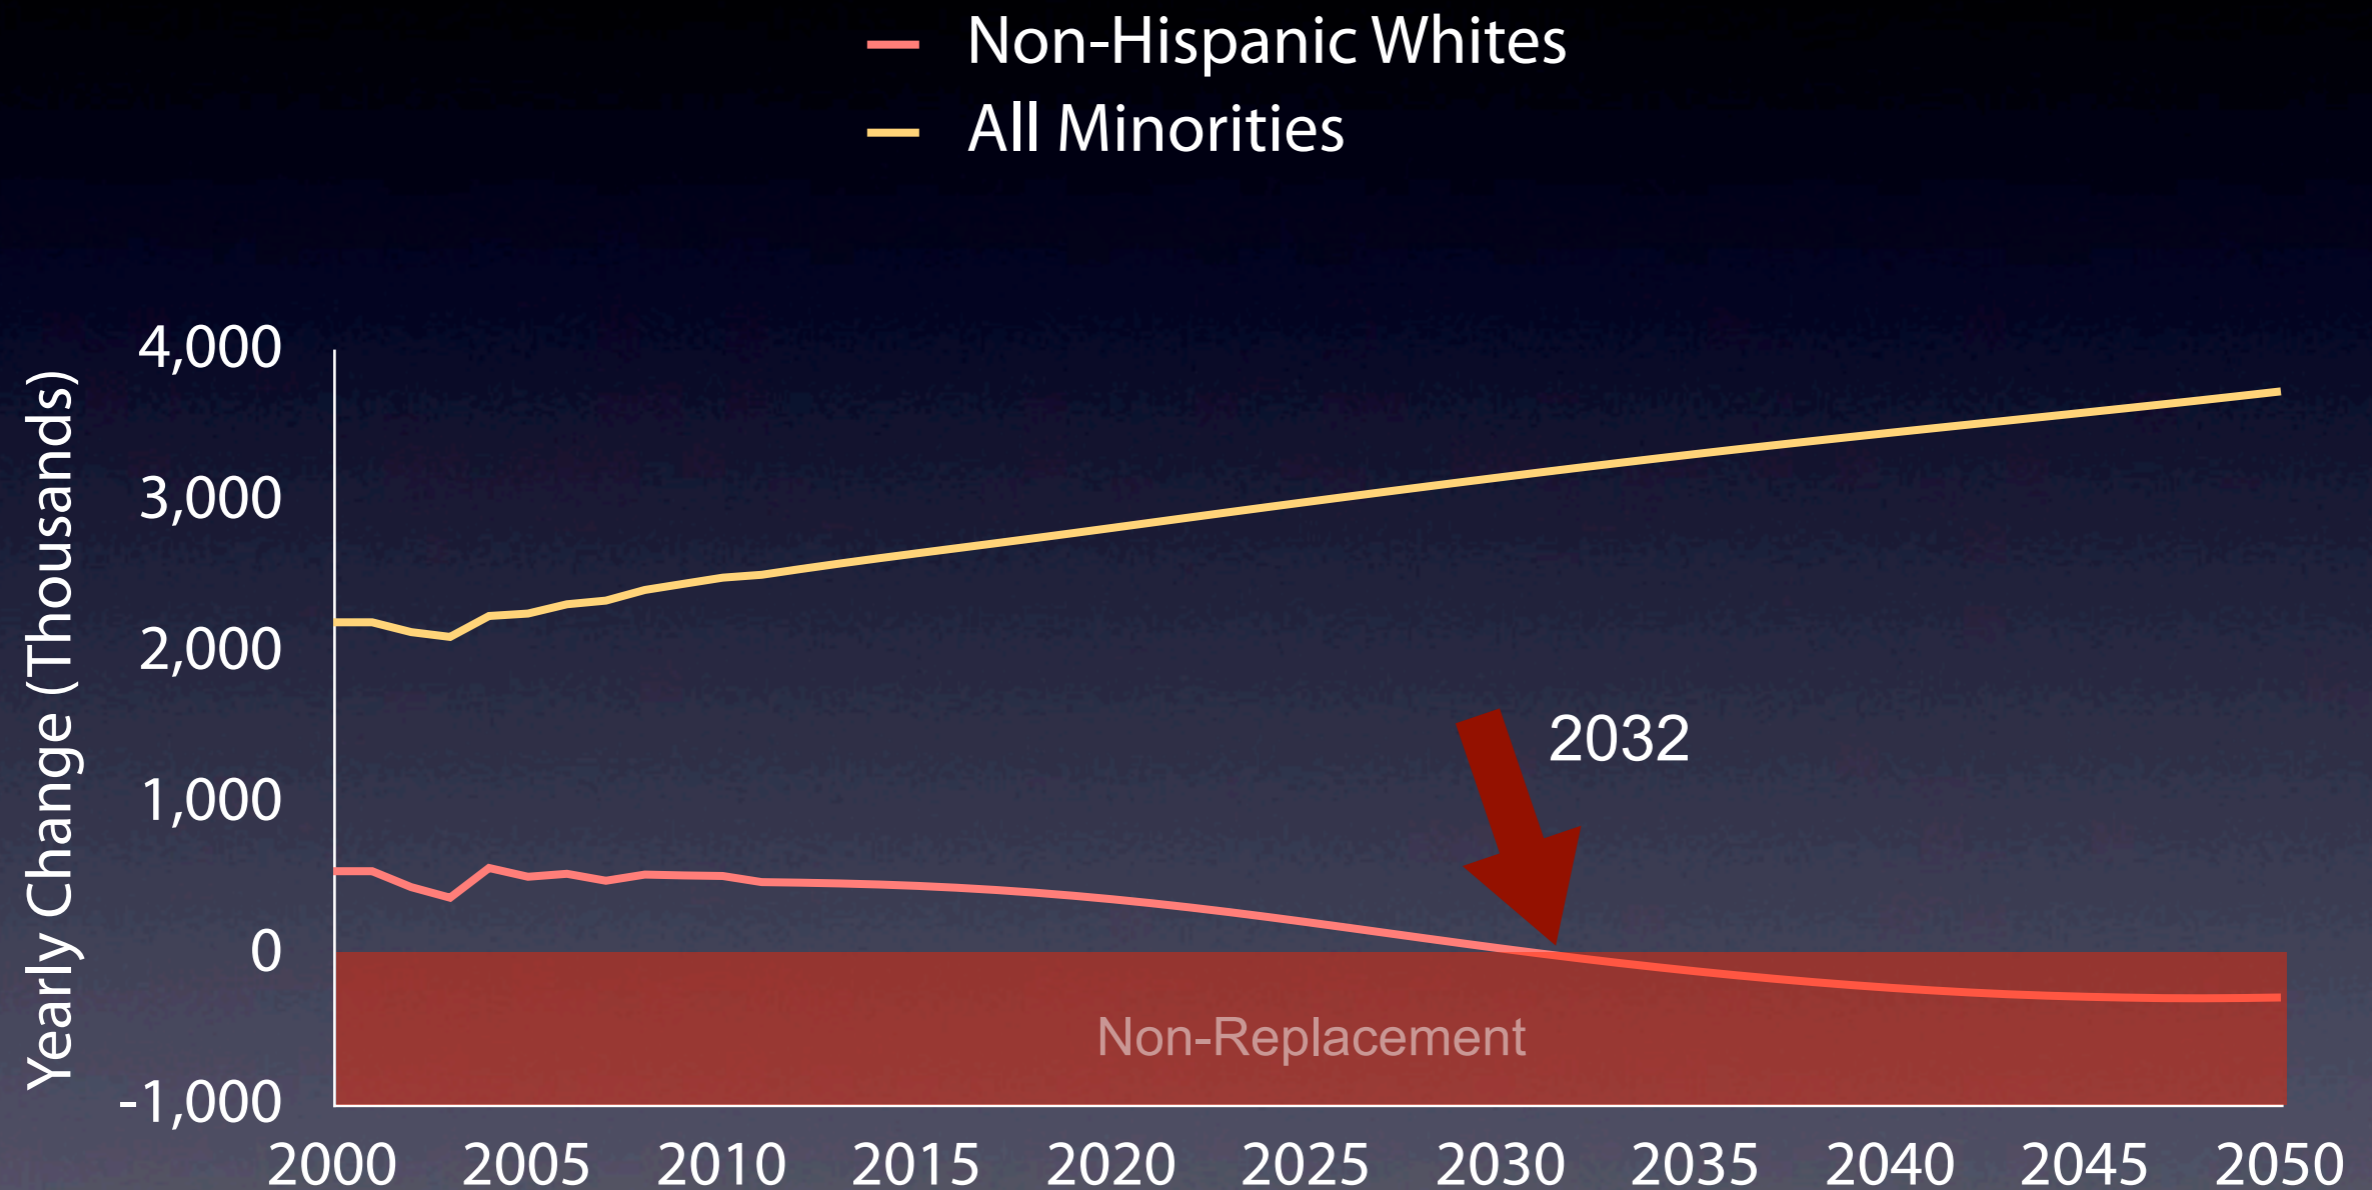

*Working Group on Political Psychology*, Harvard University, September 13, 2013

# Demographic Change in America

U.S. Census Bureau Projections (2012)

# Demographic Change in America

U.S. Census Bureau Projections (2012)

# Increased Tolerance?

- Intergroup contact theory<sup>1</sup>
  - Prejudice rooted in ignorance
  - Interracial interaction increases understanding, esp. under “optimal” conditions (e.g., status parity)
  - Meta-analytic<sup>2</sup> and experimental<sup>3</sup> support

<sup>1</sup>Allport (1954); <sup>2</sup>Pettrigrew & Tropp (2006); <sup>3</sup>Page-Gould, Mendoza-Dention, Alegre, & Siy (2010)

# Increased Tension?

- Group threat theory<sup>1,2</sup>
  - Prejudice rooted in (perceived) competition
  - Interracial diversity increases threat to the group's economic and social prerogatives
  - Whites in regions with large minority populations display more prejudice – esp. where minority population has spiked<sup>3</sup>, economy is poor<sup>4</sup>, and whites predisposed<sup>4,5</sup>

<sup>1</sup>Blumer (1958); <sup>2</sup>Bobo & Hutchings (1996); <sup>3</sup>Hopkins (2010); <sup>4</sup>Quillian (1995); <sup>5</sup>Giles & Evans (1989)

# An Identity-Centered Analysis

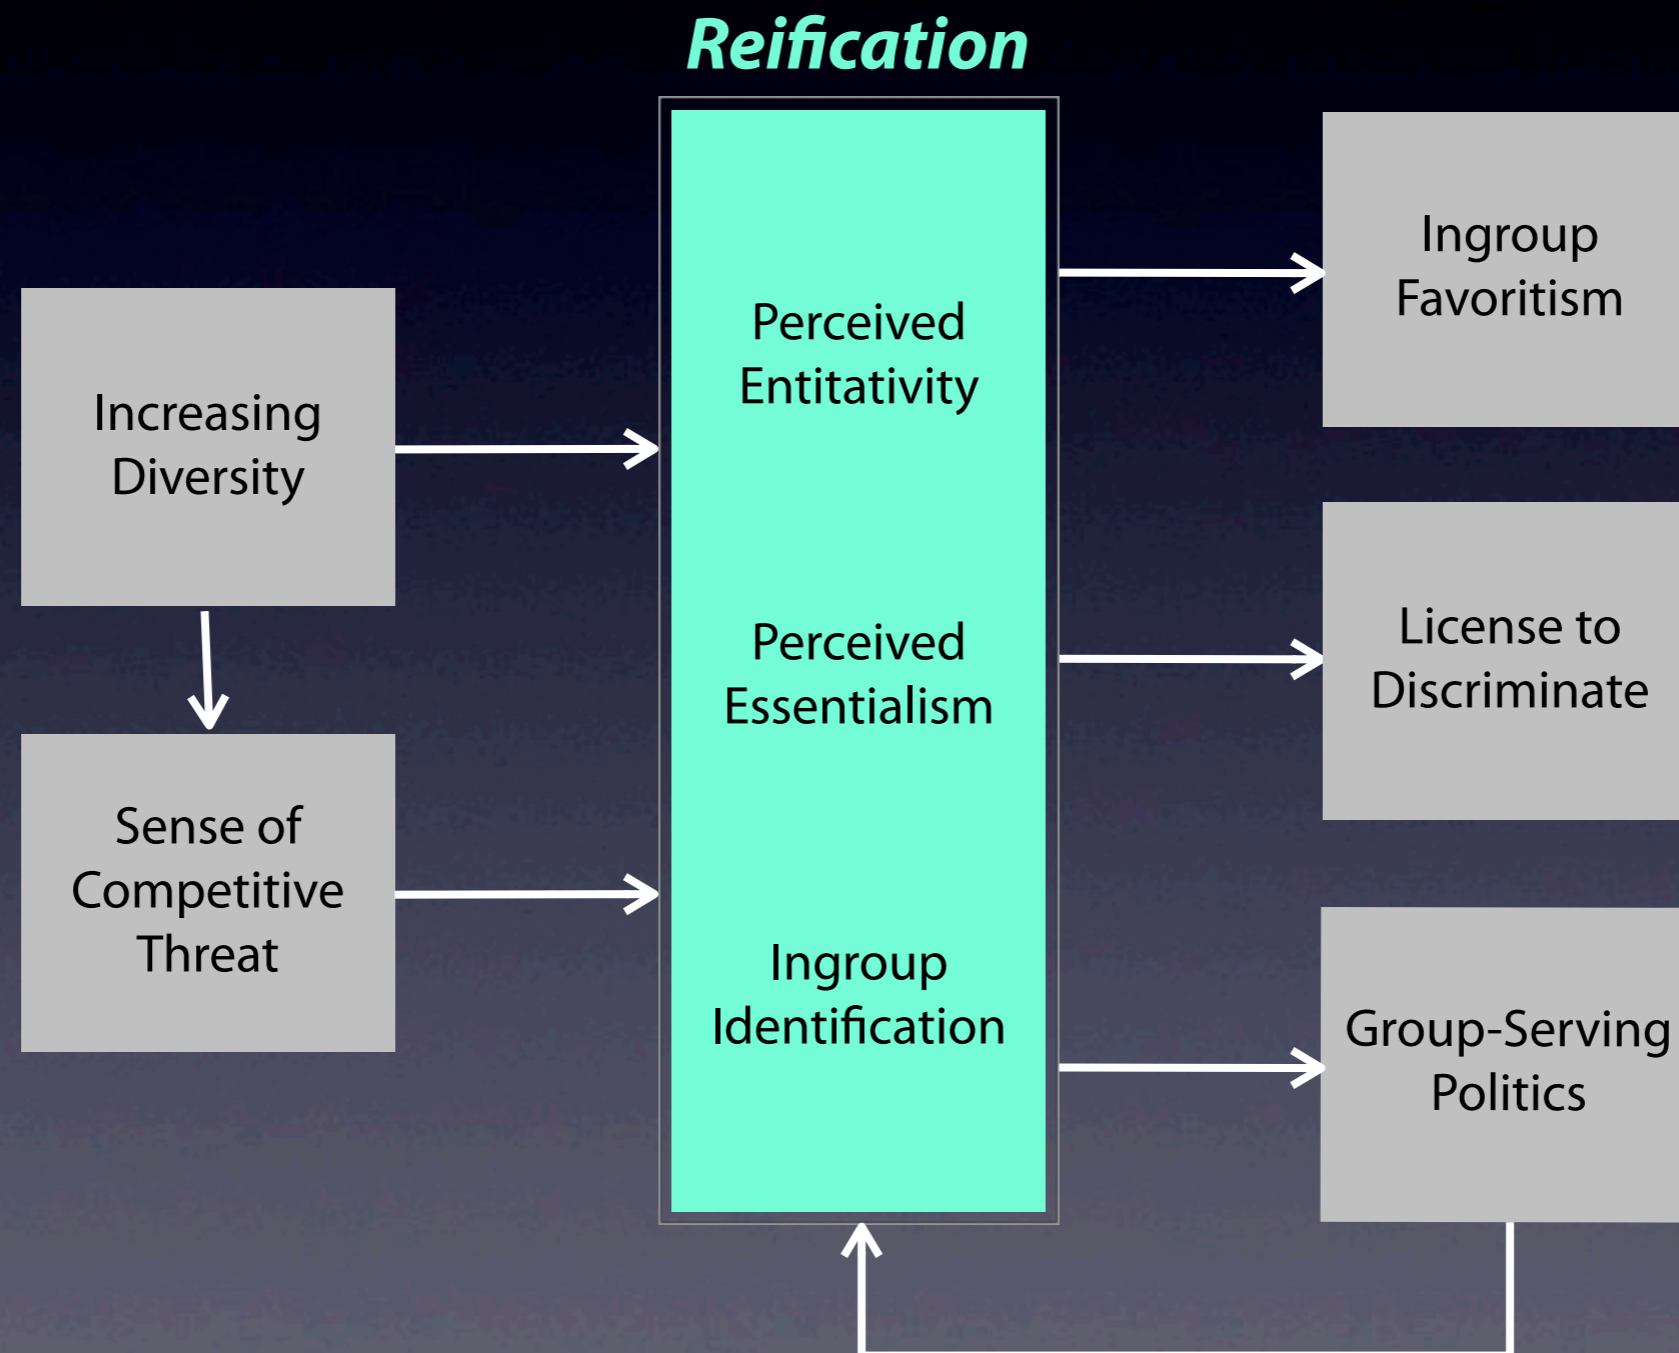

- Whites' response to demographic change will be complex rather than monolithic
- Point of departure:
  - We should model how diversity affects whites' conceptions of their *own* racial identity – and how these changes shape intergroup behavior

# White Racial Identity?

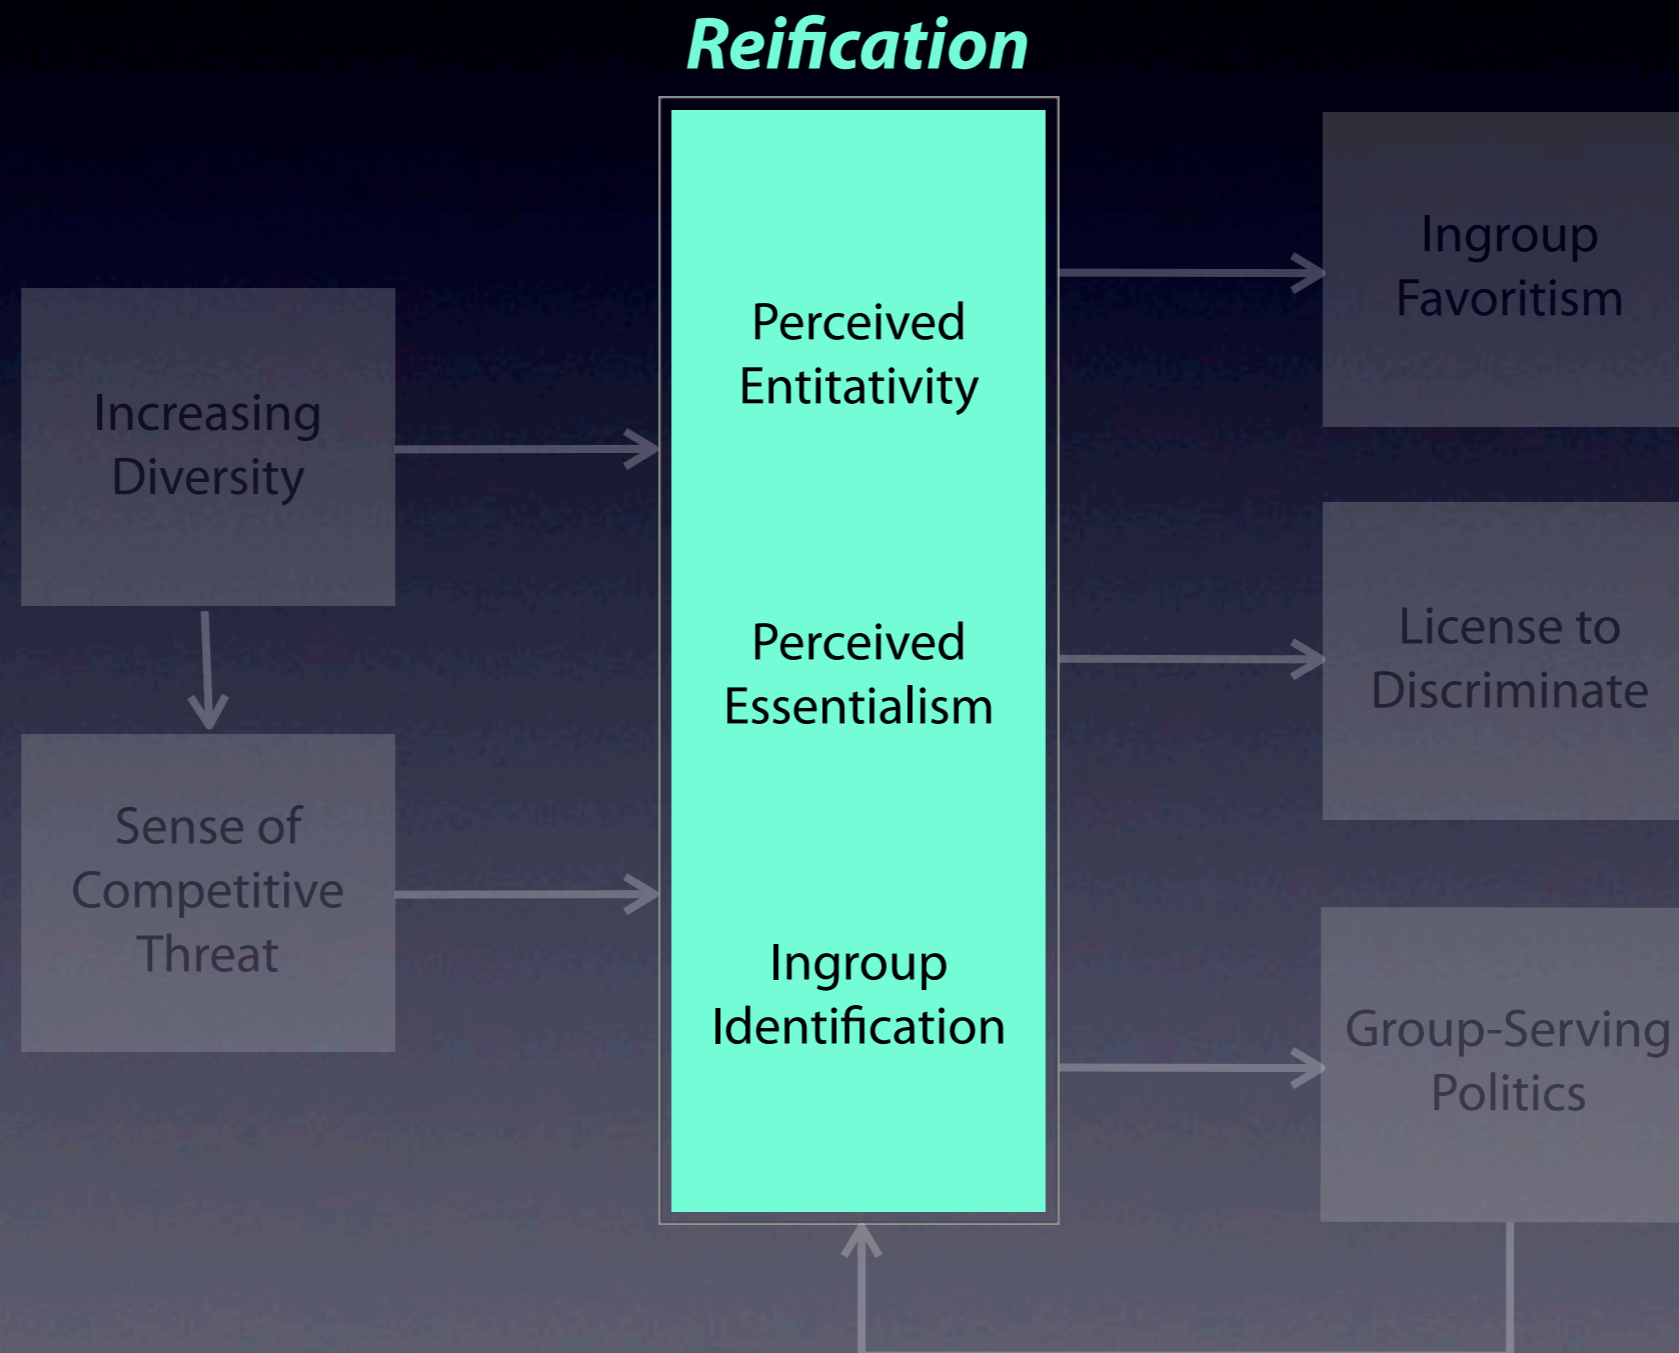

- Whites rarely introspect about it
  - “I’m not a minority”<sup>1</sup>
  - “My great-grandfather was Polish”<sup>2</sup>
  - “I’m an American”<sup>3</sup>
  - Low levels of racial identification<sup>4</sup>
- Perceptual<sup>5</sup> and normative<sup>6</sup> barriers

<sup>1</sup>Frankenberg (1993); <sup>2</sup>Perry (2002); <sup>3</sup>Devos & Banaji (2005); <sup>4</sup>Huo (2006); <sup>5</sup>McDermott & Samson (2005); <sup>6</sup>Apfelbaum, Sommers, & Norton (2008)

# Ingroup Reification Model

# Ingroup Reification Model

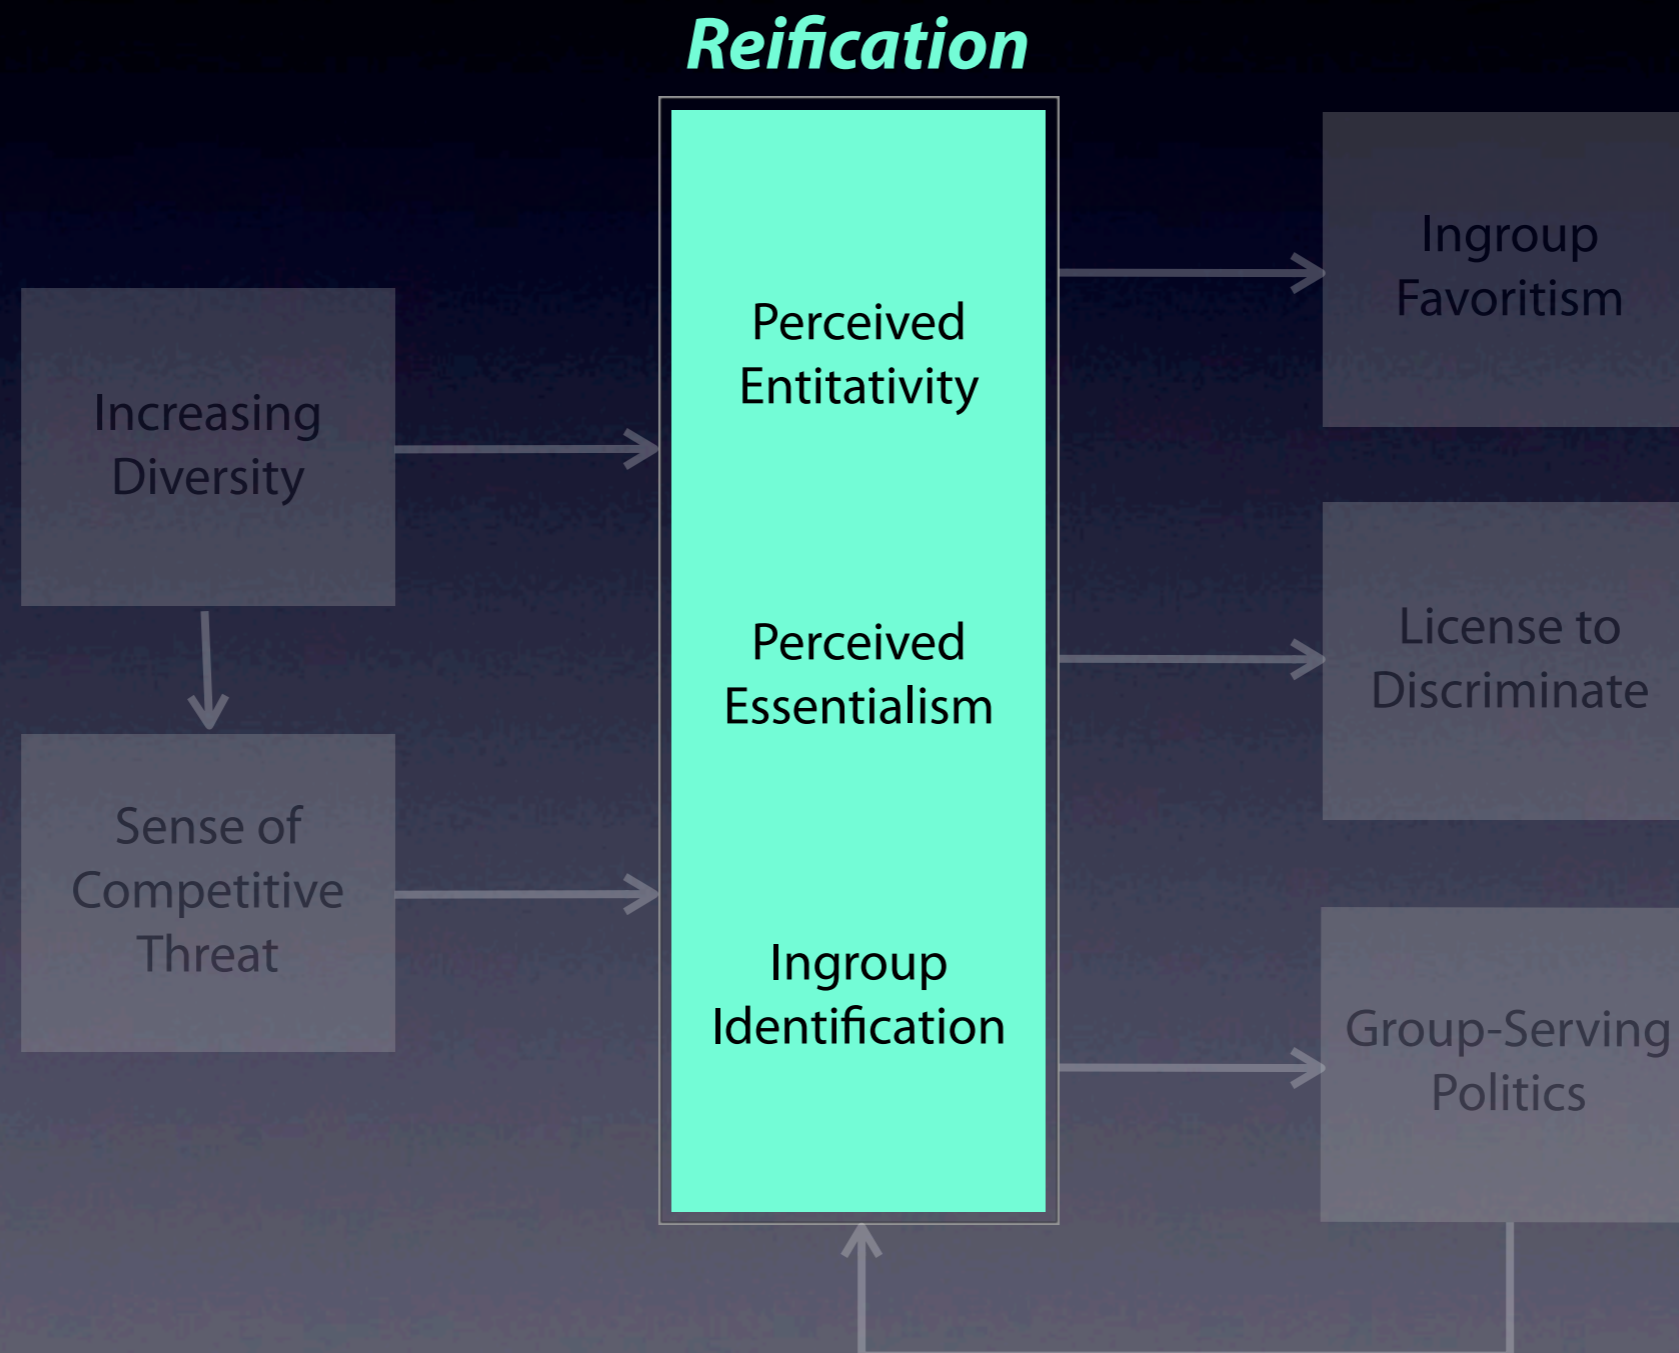

# Dimensions of Reification

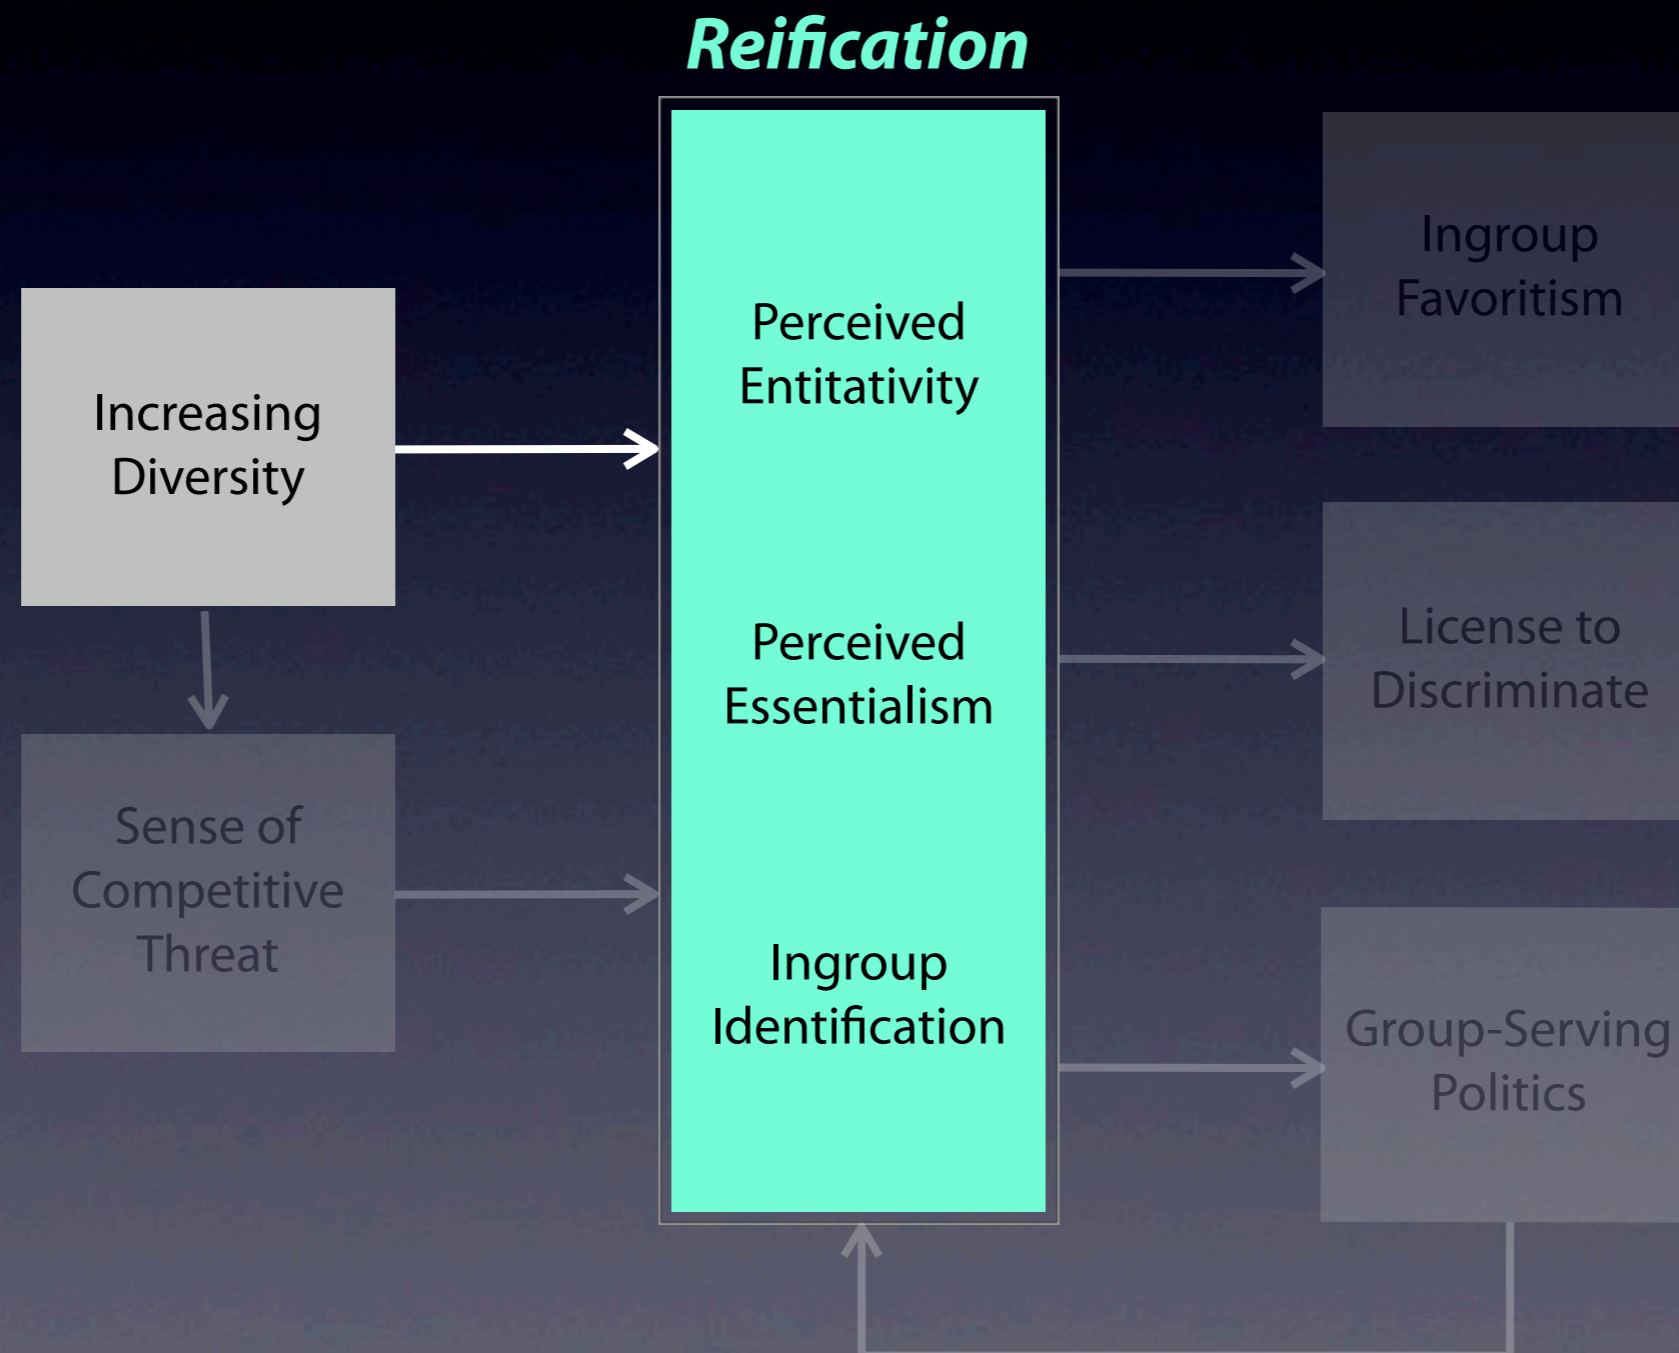

- Entitativity<sup>1</sup>
  - Perceived common fate, homogeneity
- Essentialism<sup>2</sup>
  - Sense that group is immutable, natural
- Identification<sup>3, 4</sup>
  - Mental connection between self and group

<sup>1</sup>Campbell (1958); <sup>2</sup>Haslam et al. (2000); <sup>3</sup>Leach et al. (2008); <sup>4</sup>Knowles & Peng (2005)

# Ingroup Reification Model

# Ingroup Reification Model

# Perceptual Reification

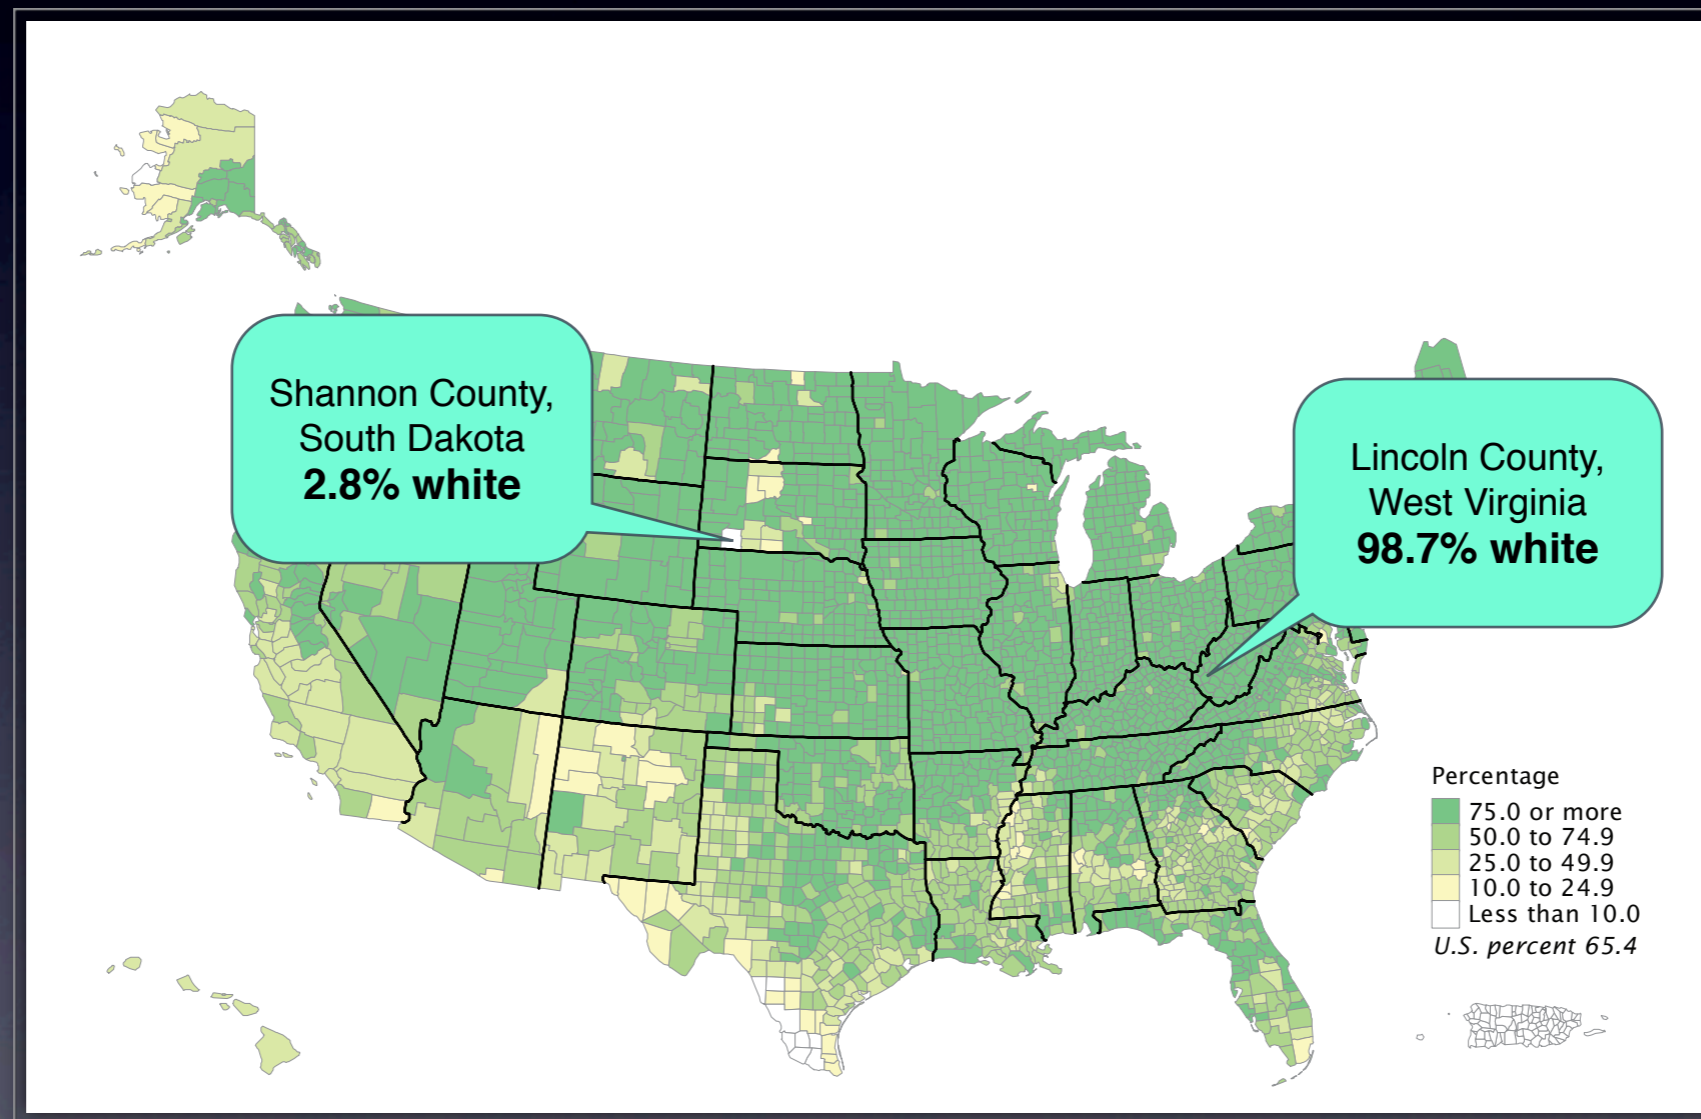

- Exposure to outgroups makes ingroup membership perceptually distinctive<sup>1</sup>
- Repeated exposure makes ingroup category chronically accessible<sup>2</sup>
- High accessibility is a precondition for “psychological group formation” (i.e., reification)<sup>3,4</sup>

<sup>1</sup>McGuire et al. (1978); <sup>2</sup>Higgins (1996); <sup>3</sup>Turner et al. (1987); <sup>4</sup>Voci (2006)

# Hints of Reification: Exposure and Identification

- Knowles and Peng (2005)
  - 262 non-Hispanic whites
  - White identity measures:
    - White Identity Centrality IAT (N=100)
    - Identity centrality questionnaire (N=162)
  - Census-derived index of outgroup exposure

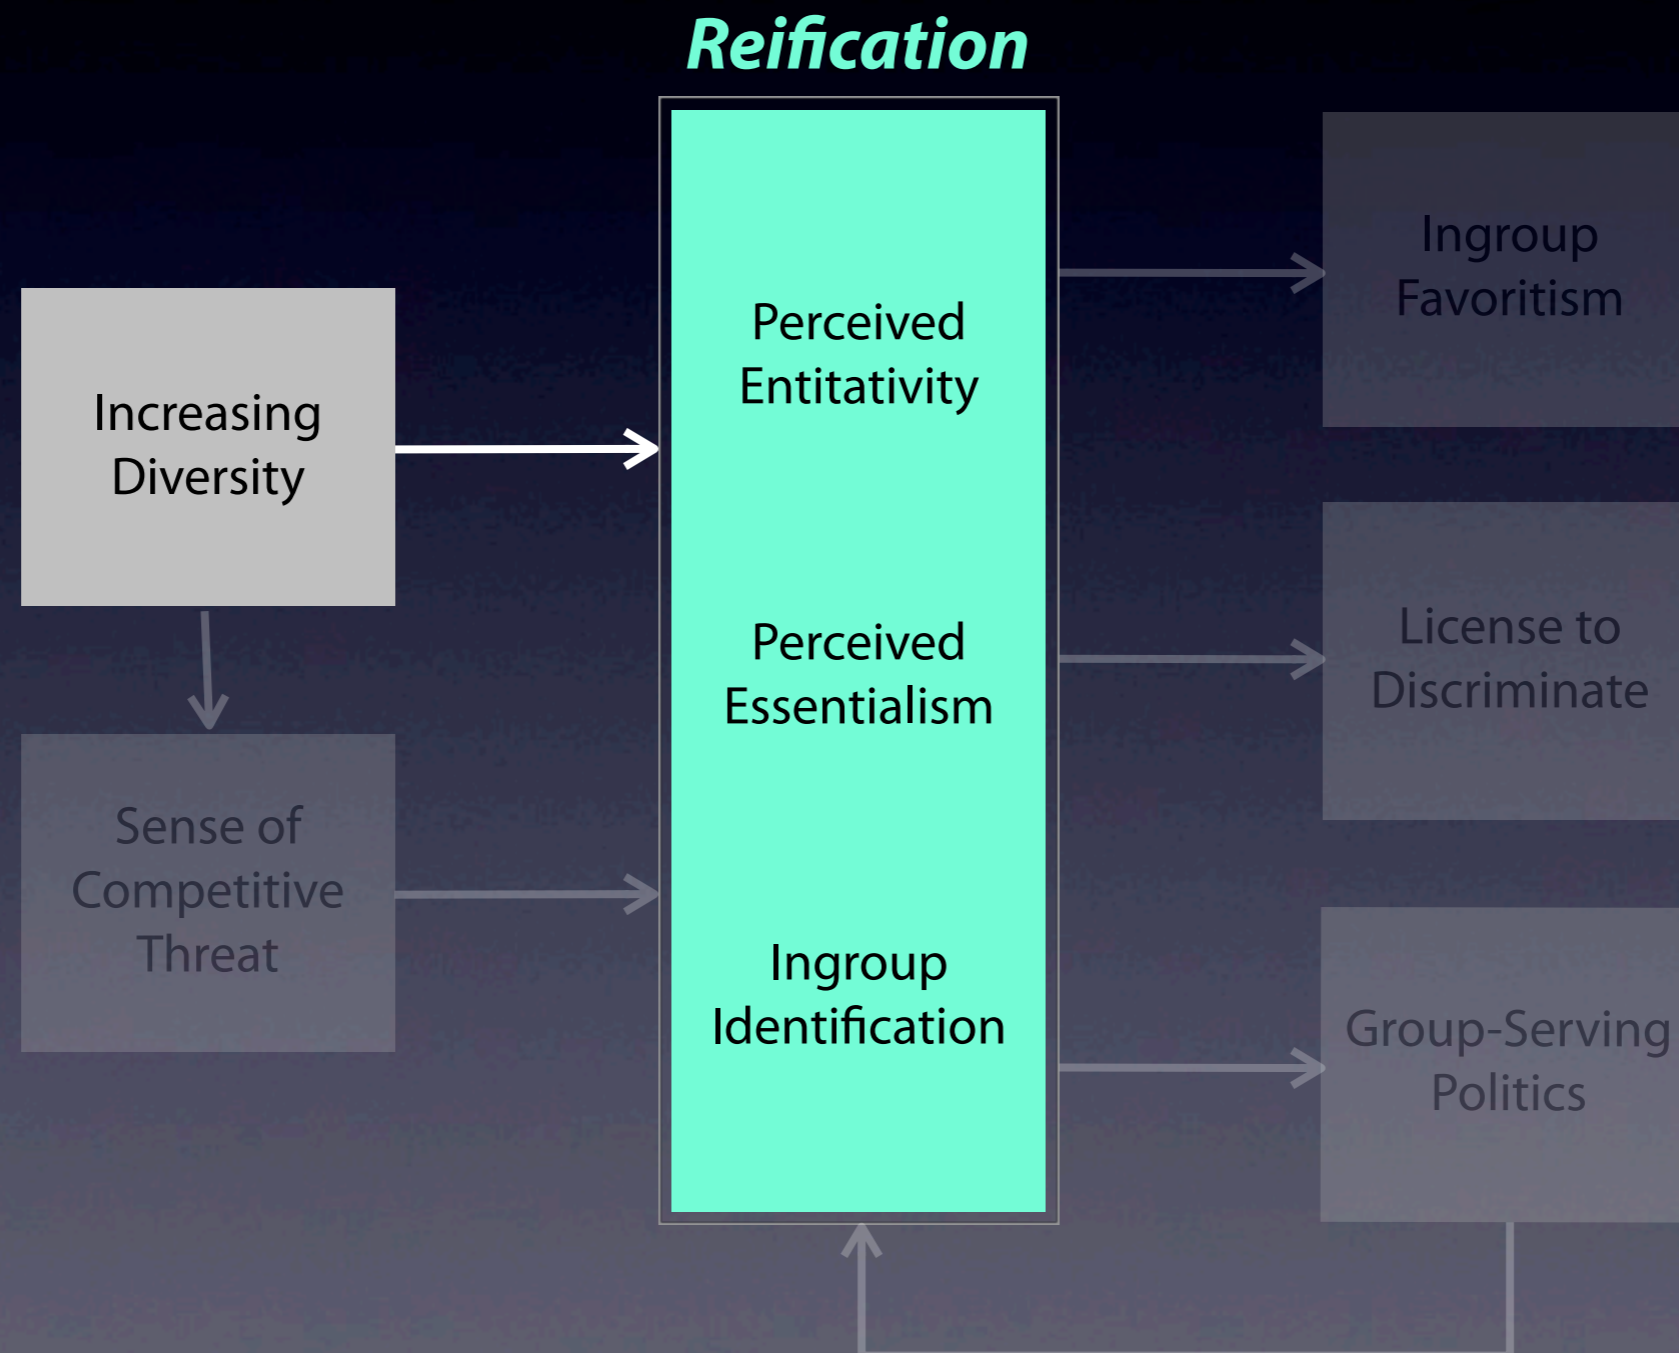

# White Population by County

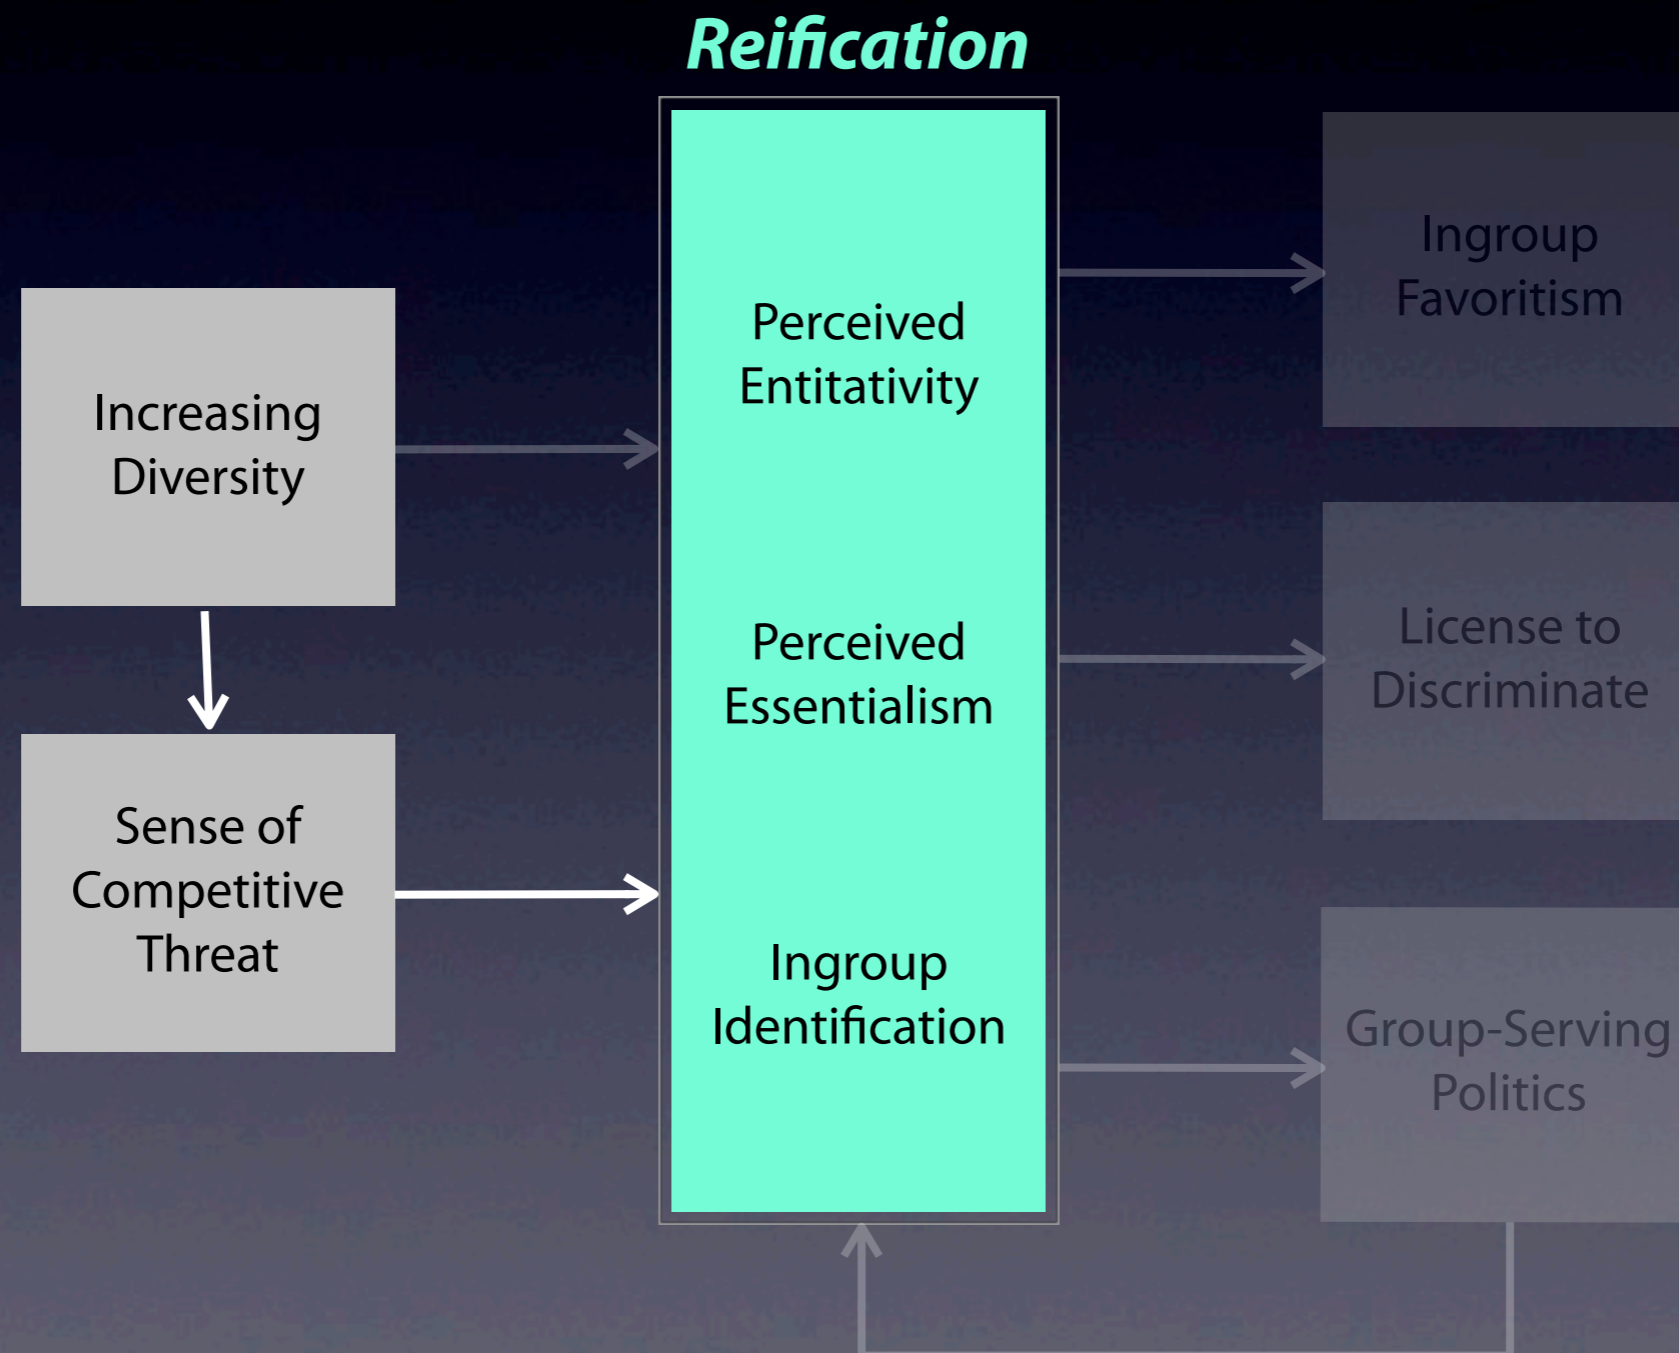

# Hints of Reification: Exposure and Identification

- Outgroup exposure predicts White identification
  - Explicit Identity:  $r = .20^{**}$
  - Implicit Identity:  $r = .16^{**}$

# Ingroup Reification Model

# Ingroup Reification Model

# Threat-Mediated Reification

- Perceived “competitive threat” (usually inferred from prejudice) increases with relative size of outgroup population<sup>1-3</sup>
- Perceived challenge to ingroup’s economic and social prerogatives
- For whites, feelings of competitive threat should increase ingroup entitativity<sup>4</sup> and identification<sup>5</sup>

<sup>1</sup>Fossett & Kiecolt (1989); <sup>2</sup>Quillian (1995); <sup>3</sup>Quillian (1996); <sup>4</sup>LeVine & Campbell (1986)

<sup>5</sup>Tajfel & Turner (1986)

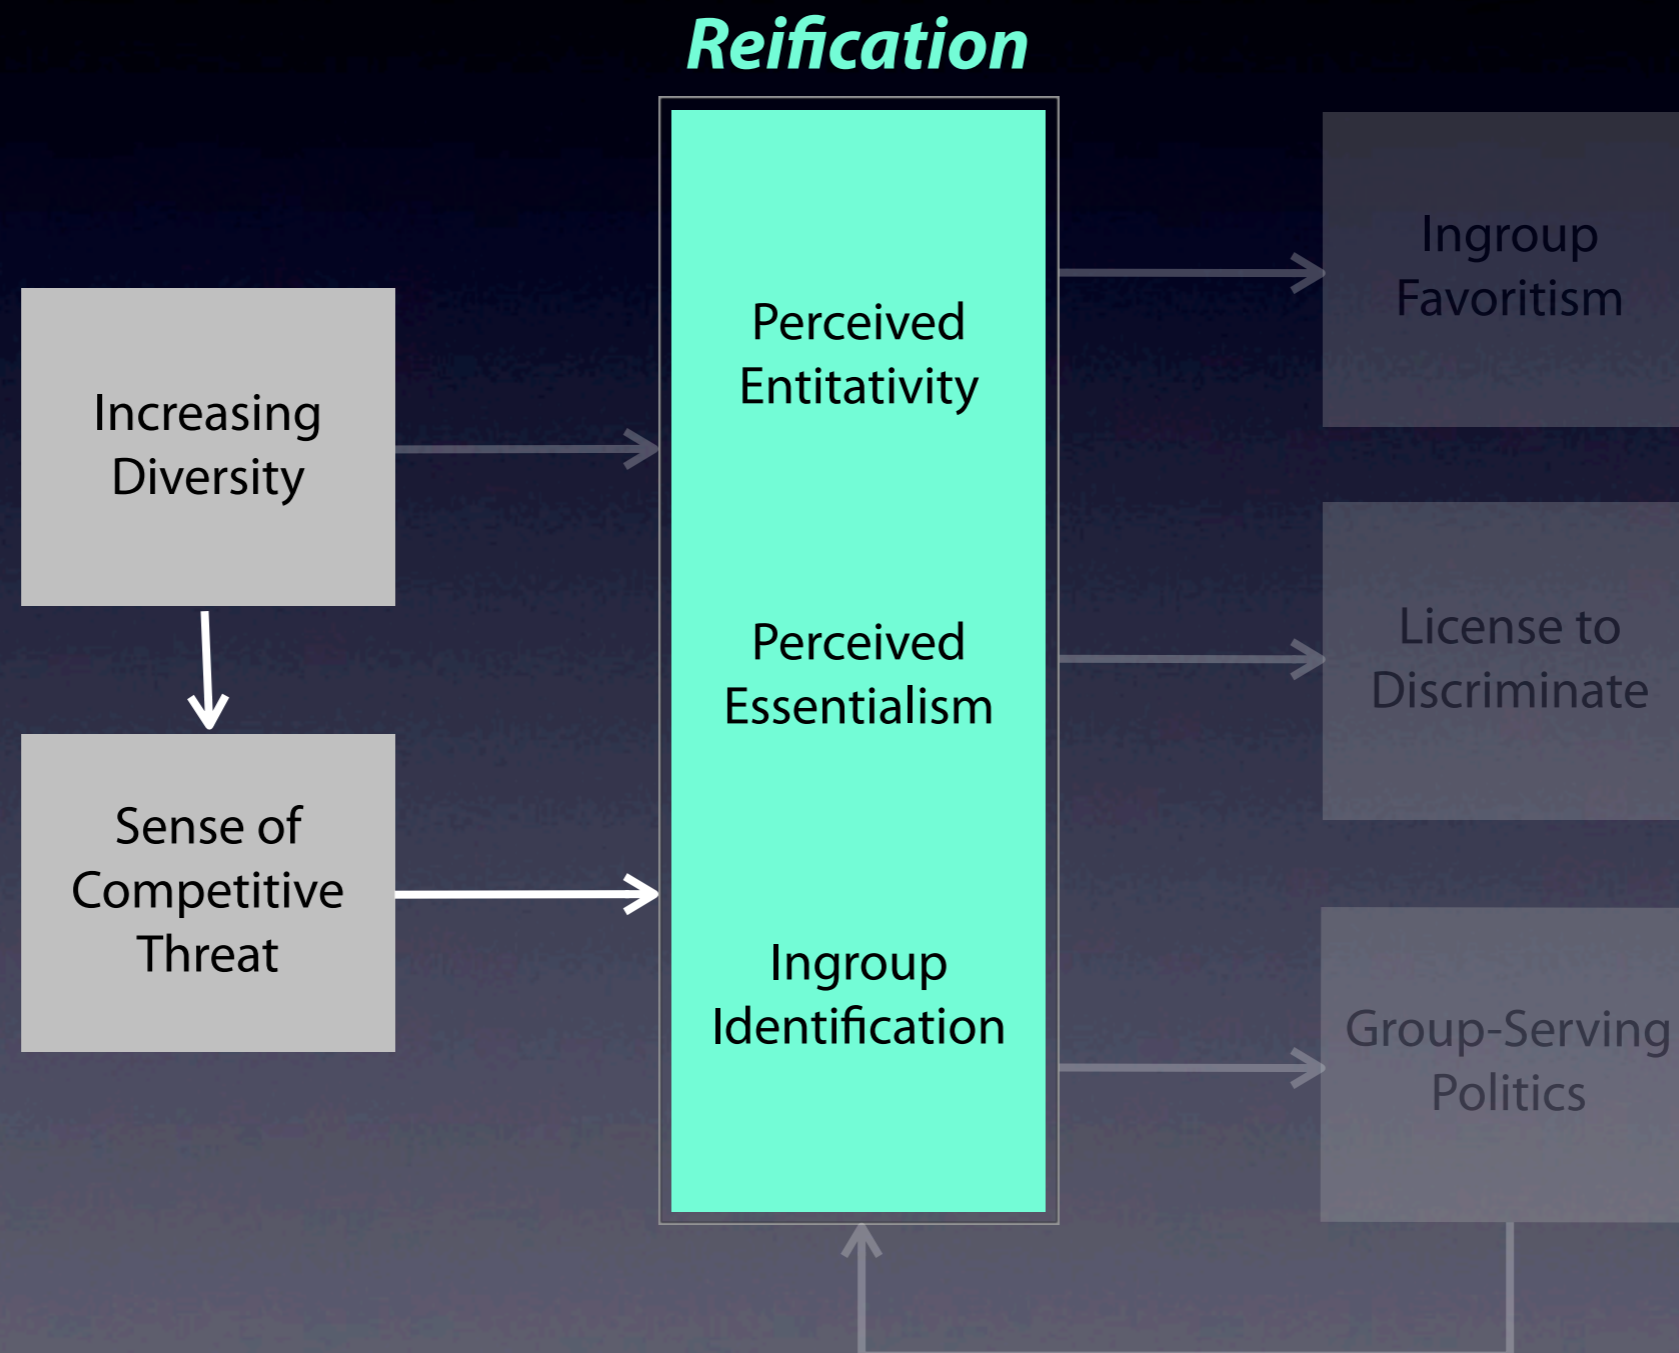

# Hints of Reification: Threat

- Giles and Evans (1985)
  - Data from 1972 American Election Study
  - White identification = ingroup warmth
  - County % black predicted perceived threat
  - Perceived threat predicted identification

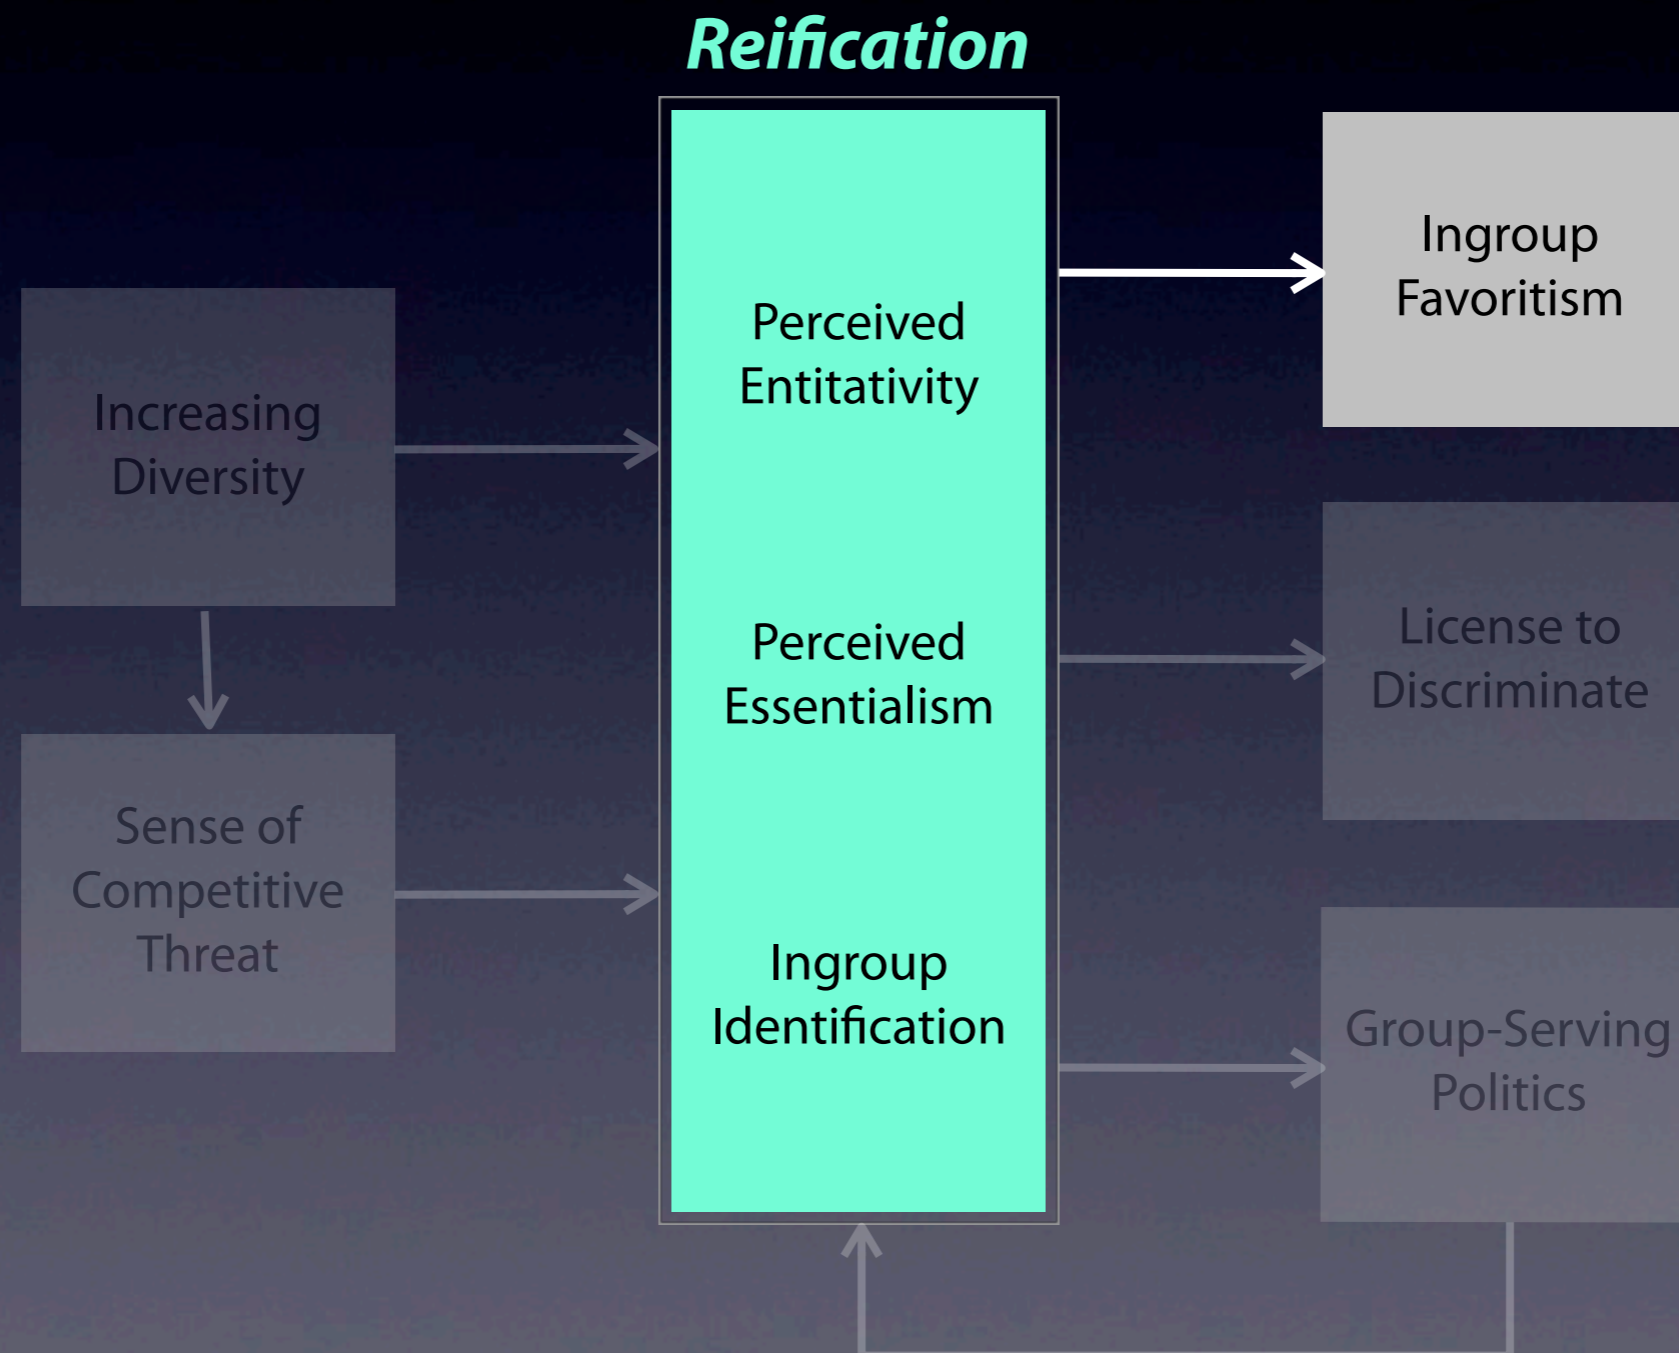

# Hints of Reification: Threat

- Outten, Schmitt, Miller, and Garcia (2012)
  - Manipulated white Canadians' awareness of (their) majority-minority crossover
  - Awareness led to more:
    - Anger and fear toward racial outgroups
    - Sympathy for and identification with ingroup (e.g., "I feel strong ties to ... my ethnic group")

# Ingroup Reification Model

# Ingroup Reification Model

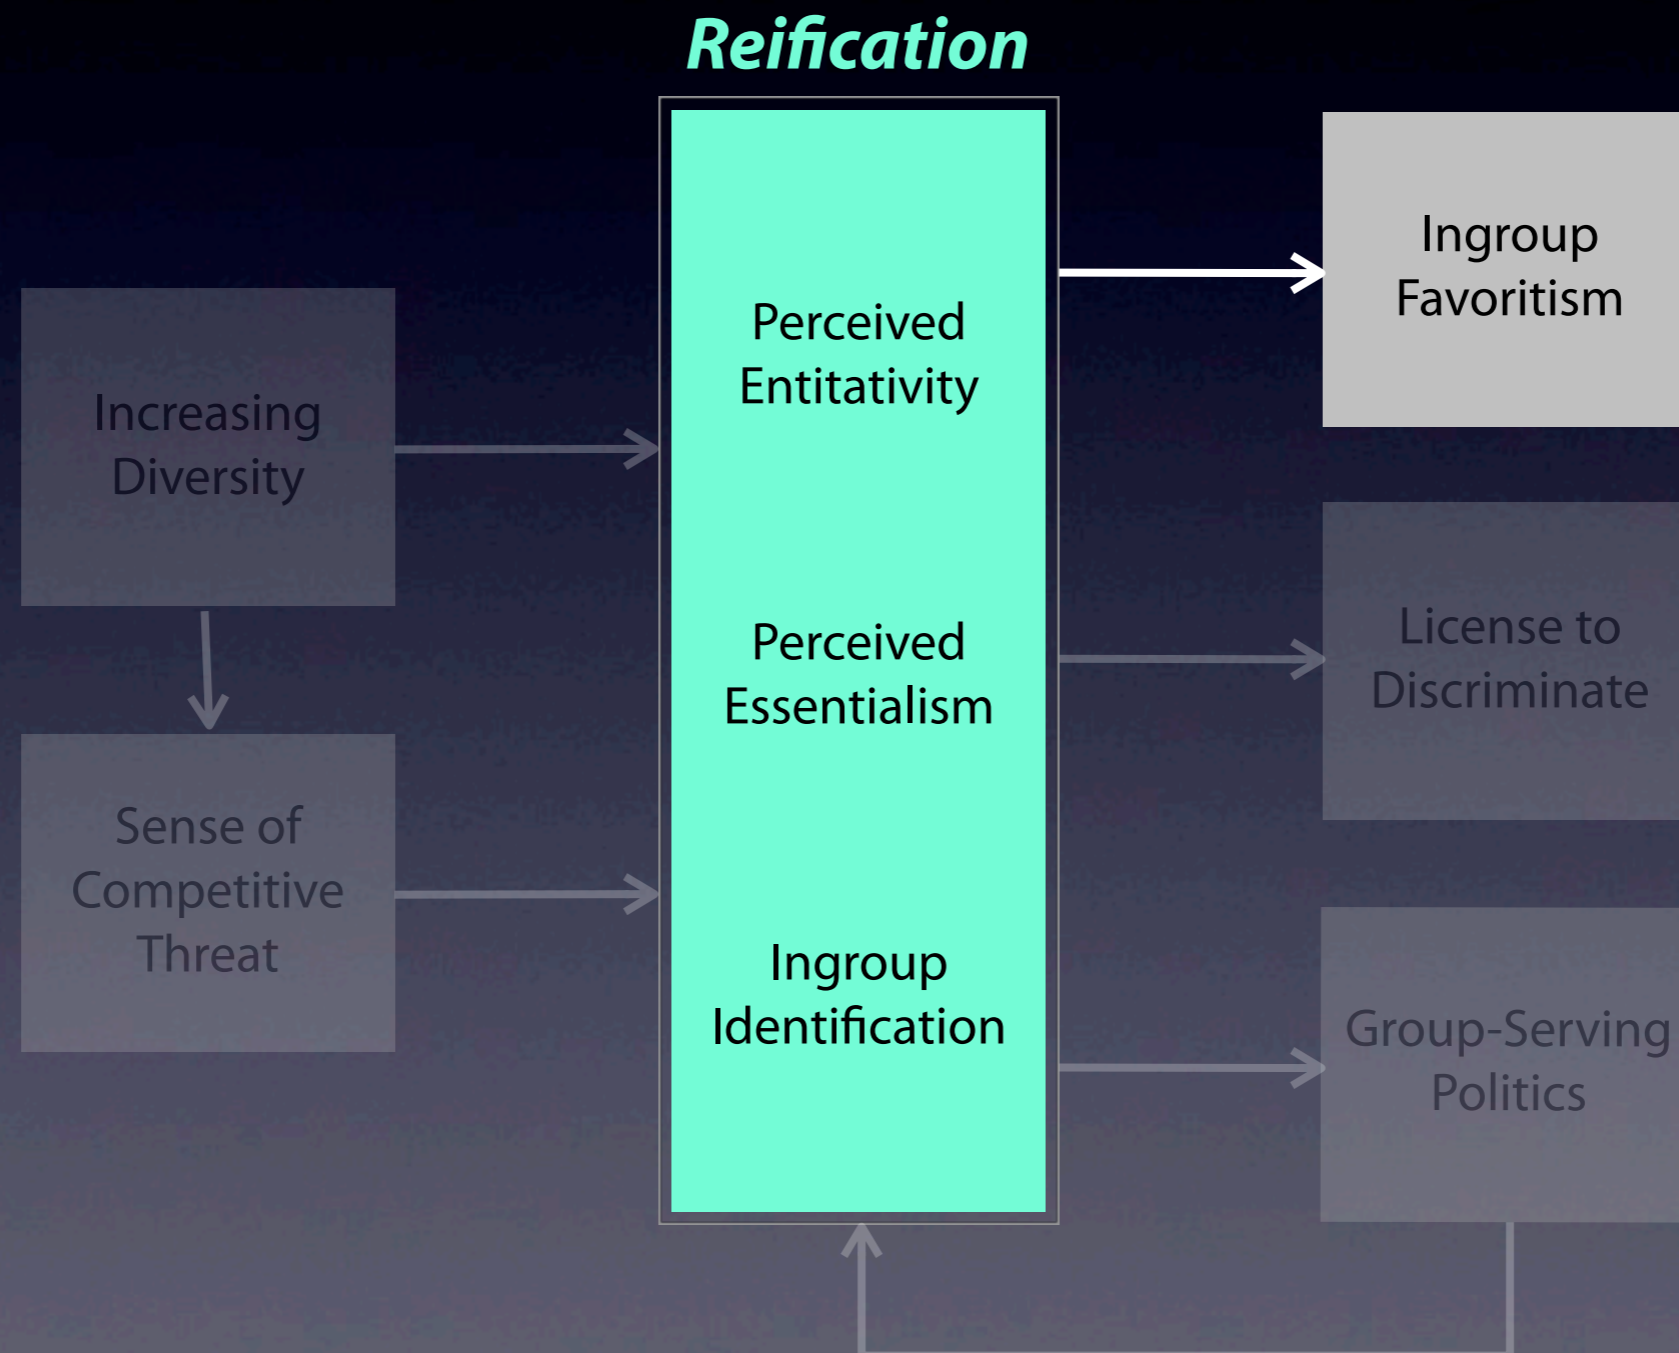

# Ingroup Favoritism

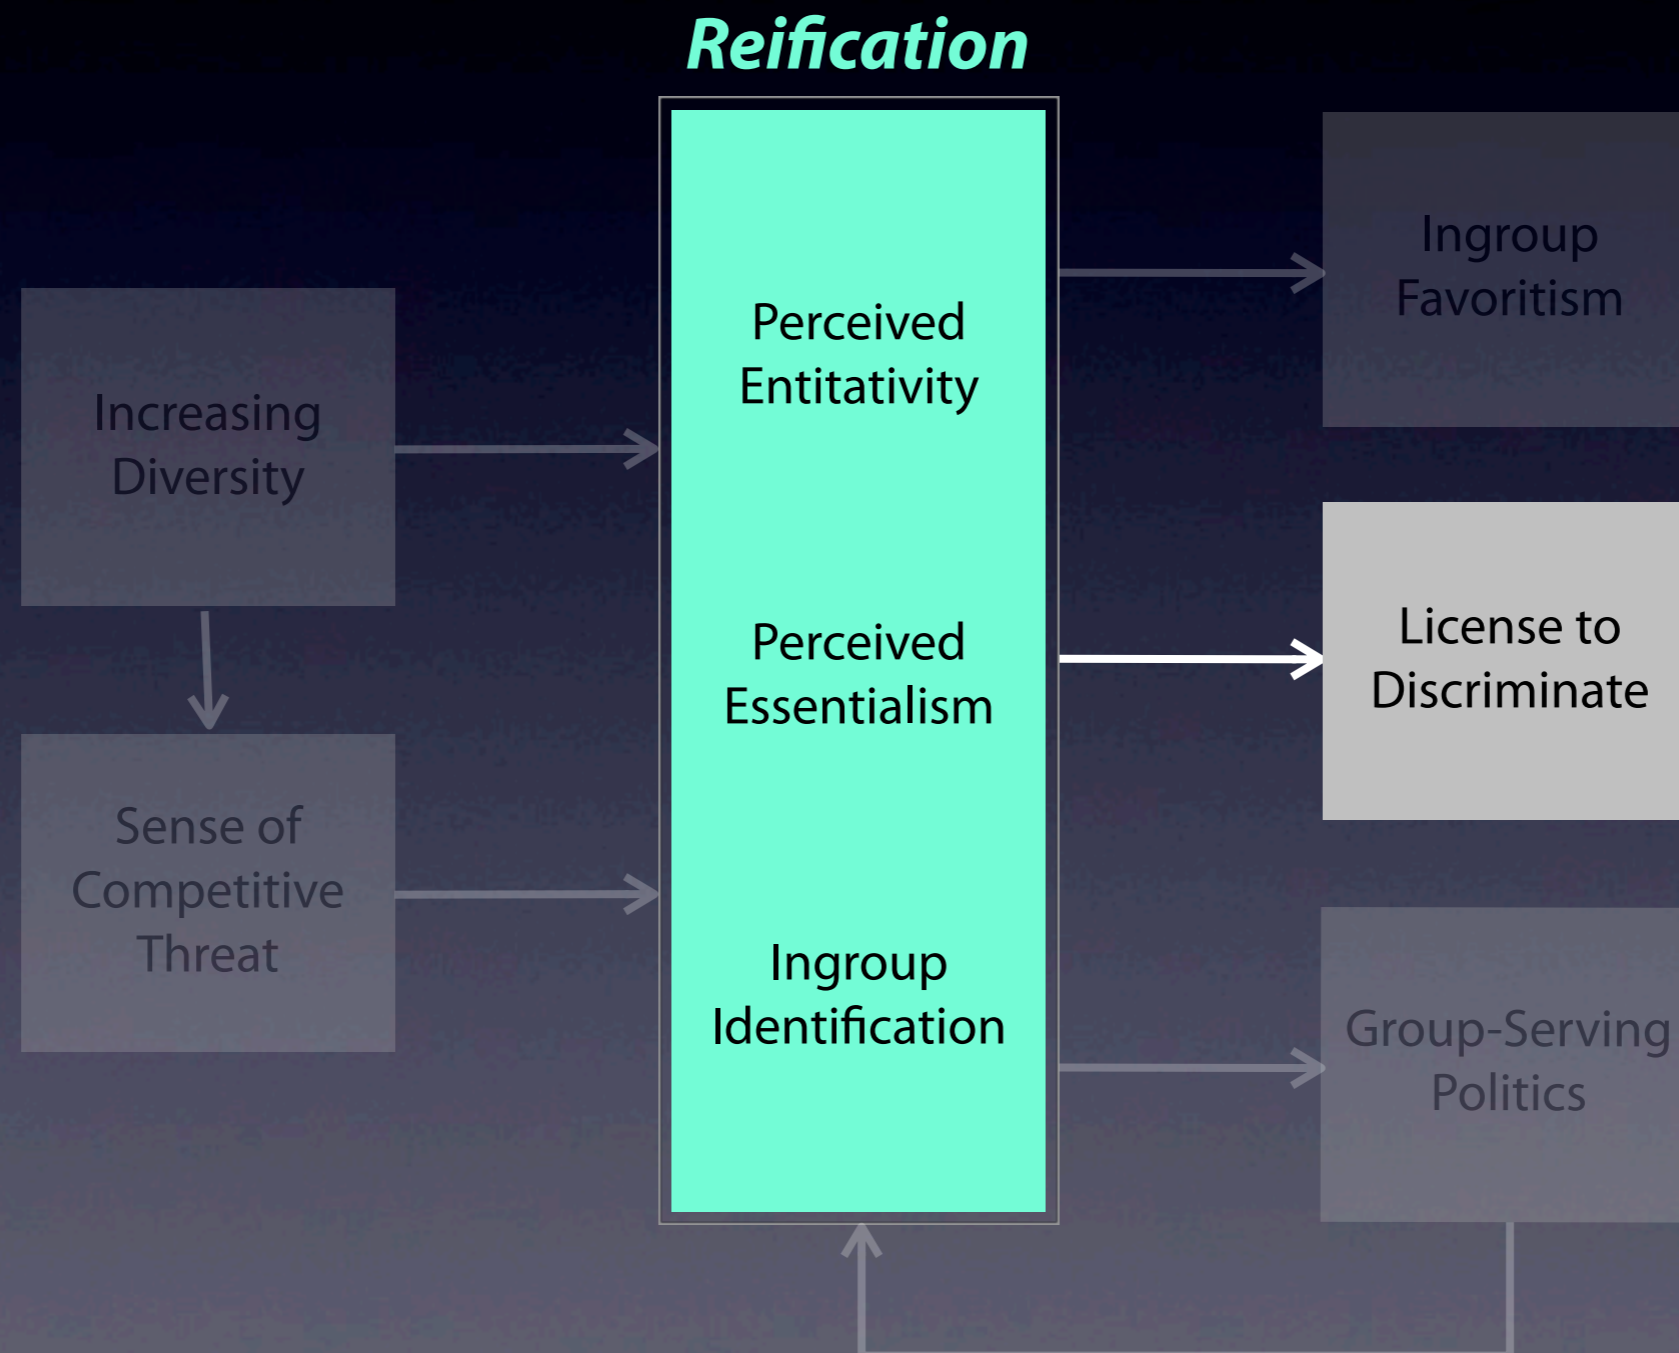

- *Ingroup entitativity* predicts ingroup-favoring attitudes and behavior<sup>1</sup>
- Racial *essentialism* predicts tolerance for inequality and disinterest in intergroup contact<sup>2</sup>
- *Identification* creates desire for positive ingroup distinctiveness<sup>3, 4</sup>

<sup>1</sup>Gaertner & Schopler (1998); <sup>2</sup>Williams & Eberhardt (2008); <sup>3</sup>Tajfel & Turner (1978)

# Ingroup Reification Model

# Ingroup Reification Model

# License to Discriminate

- Rationalist lay theory of intergroup bias<sup>1</sup>
  - Prejudice and discrimination as *natural* and *rational* in pursuit of one's group-interest<sup>2</sup>
  - Add naturalistic fallacy<sup>3</sup> ... and bias that reflects group-interest seen as *legitimate*
  - That is, one has the *moral standing*<sup>4</sup> to be biased because of plausible group-interested concerns

<sup>1</sup>Effron & Knowles (in progress); <sup>2</sup>LeVine & Campbell (1986); <sup>3</sup>Eidelman, Crandall, & Pattershall (2009); <sup>4</sup>Miller & Effron (2010)

# License to Discriminate

- You have *moral standing*<sup>1</sup> to be biased if
  1. You have group-interests ... thus that one's "group" is a real – reified! – group
  2. Another group is threatening your group's resources
- "Skin in the game"

<sup>1</sup>Miller & Effron (2010)

# License to Discriminate

- Effron and Knowles (in progress)
  - 248 participants
  - Shown 2 racial-ethnic groups (A and B) from set of Blacks, Latino/as, Asians, and whites
  - Ratings
    - Moral acceptability of A discriminating against B
    - Moral acceptability of B discriminating against A

# License to Discriminate

- How *socially acceptable* is it for a member of Group A to...
  1. tell a joke that plays on negative stereotypes of B?
  2. prefer not to hire B because of his race?
  3. prefer her child not marry B because of his race?
  4. prefer not to associate with B because of his race?
  5. make a prejudicial remark about B?
  6. refuse to shop at a store that is owned by B?
  7. believe that A are superior to B?

# License to Discriminate

- Ratings (cont.)
  - **Entitativity**<sup>3</sup> (cooperation, similarity, fate)
  - **Social status** (ladder probe)
  - **Past victimization** (history of prejudice against the group)
  - **Size** (percentage of population)
  - **Own attitude** (feeling thermometer)

<sup>3</sup>Denson, Lickel, Curtis, Stenstrom, & Ames (2006)

# Perceived Acceptability of Bias

Mixed-model regression (two discrimination scores for each participant)

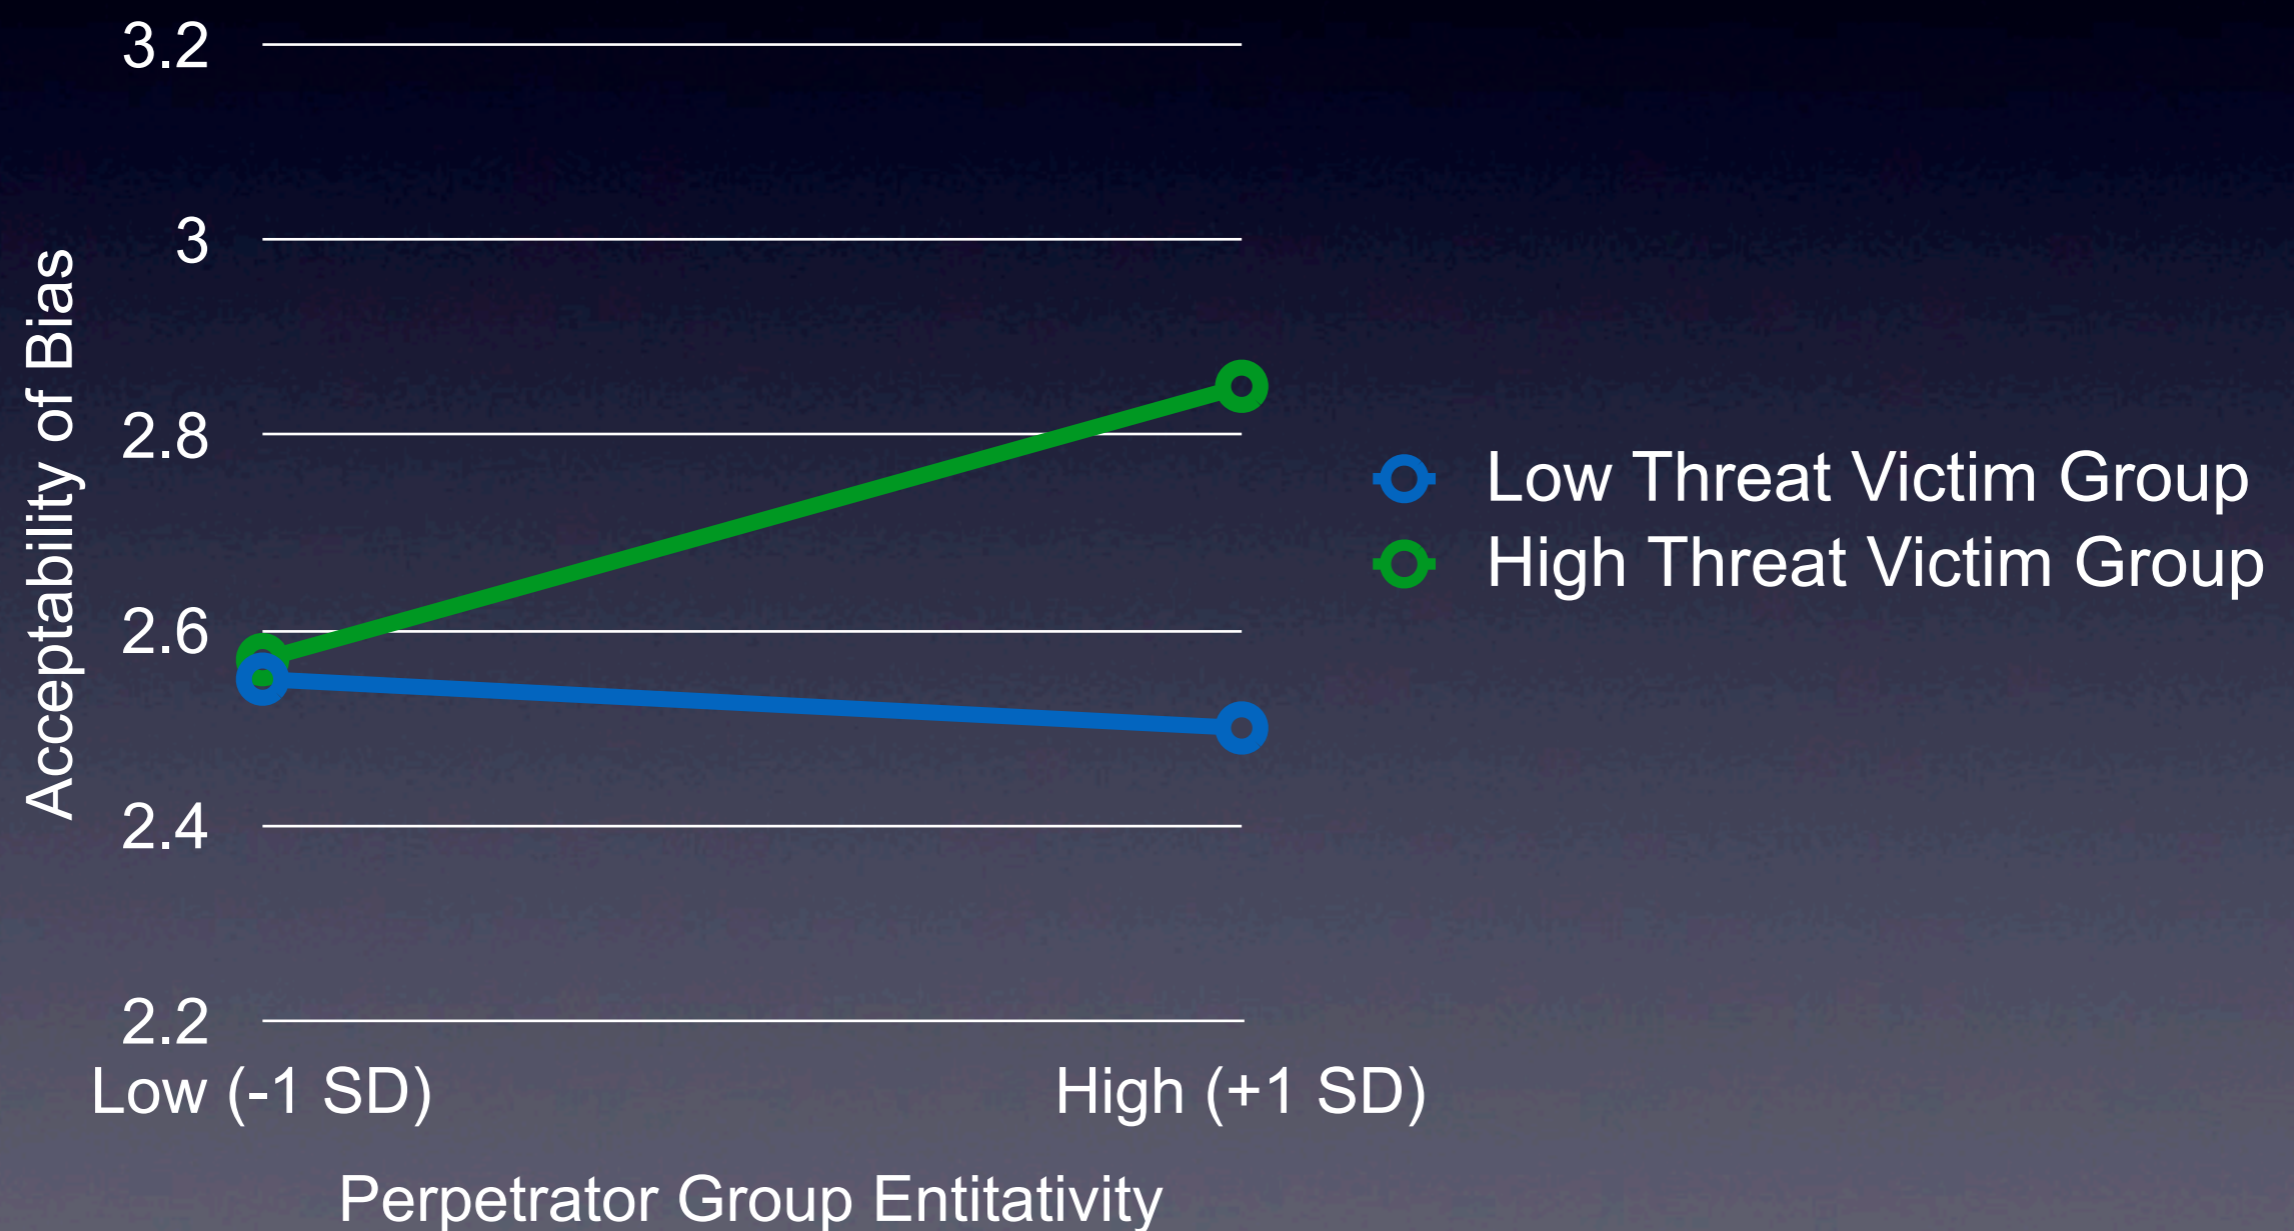

Predictor	Perp Group (z)	Targ Group (z)
<b>Entitativity</b>	<b>2.47*</b>	-1.16
<b>Past victimization</b>	0.98	<b>3.31**</b>
Social status	-0.88	-0.3
Size	-0.21	1.54
Own attitude	0.42	0.75

# License to Discriminate

- Effron and Knowles (in progress)
  - 252 participants
  - Same design as before
  - Addition of Intergroup Threat scale<sup>1</sup>
    - Measures zero-sum intergroup competition
    - E.g., “More good jobs for [Group A] means fewer good jobs for [Group B]”

<sup>1</sup>Bobo & Hutchings (1996)

# License to Discriminate

# License to Discriminate

- Degree of correspondence between implicit and explicit measures of an attitude varies with social desirability<sup>1</sup>
- Evidence for motivated biases in self-report
- Self-perceived moral license should reduce such bias and increase implicit-explicit correspondence

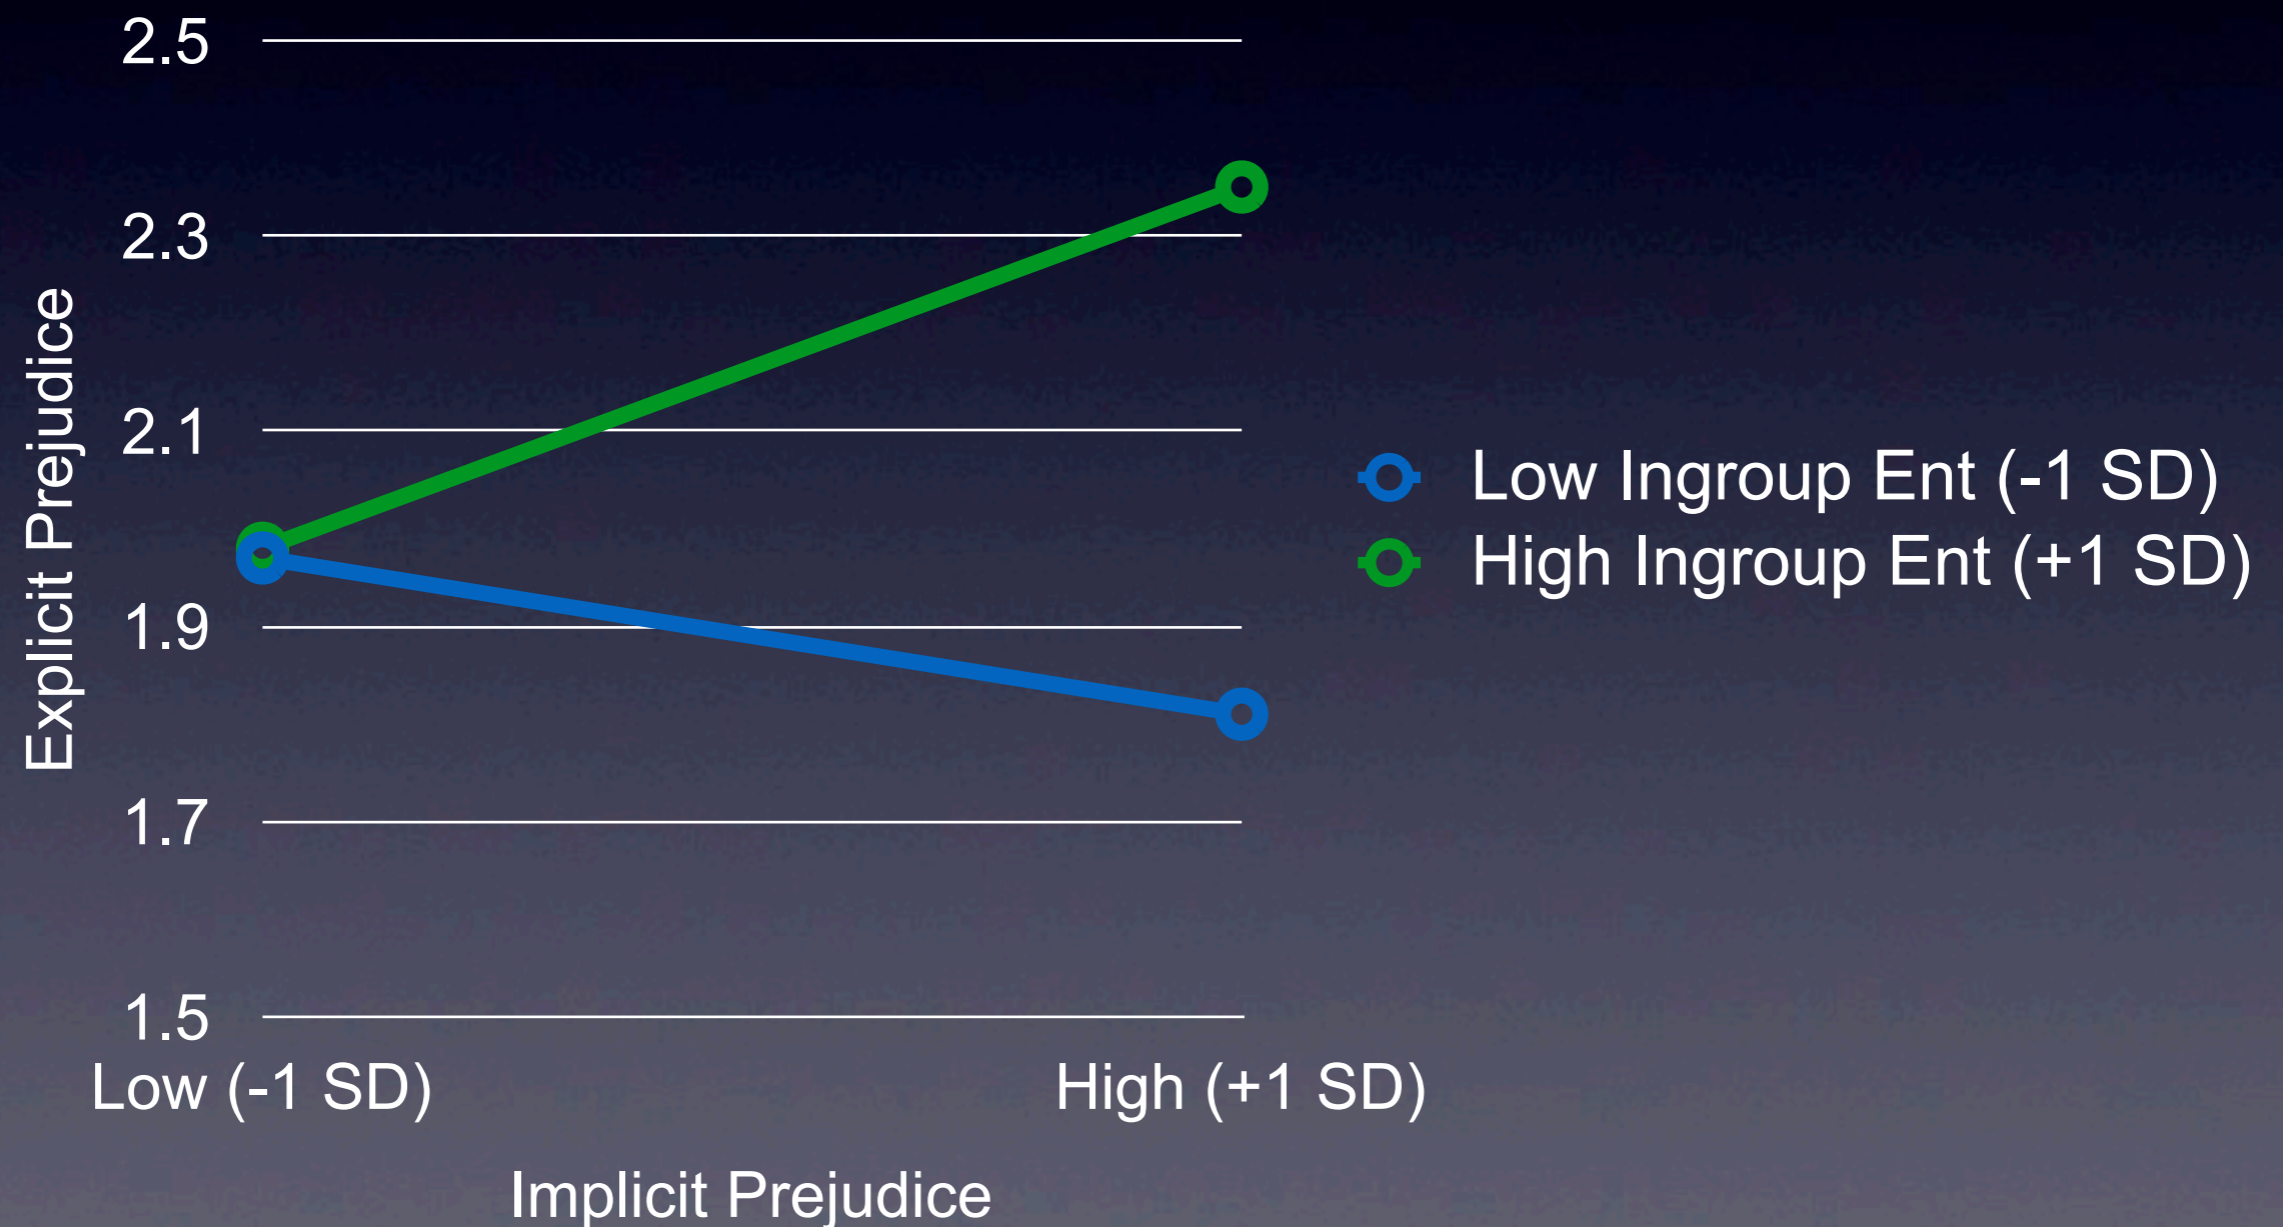

<sup>1</sup>Hofmann et al. (2005)

# License to Discriminate

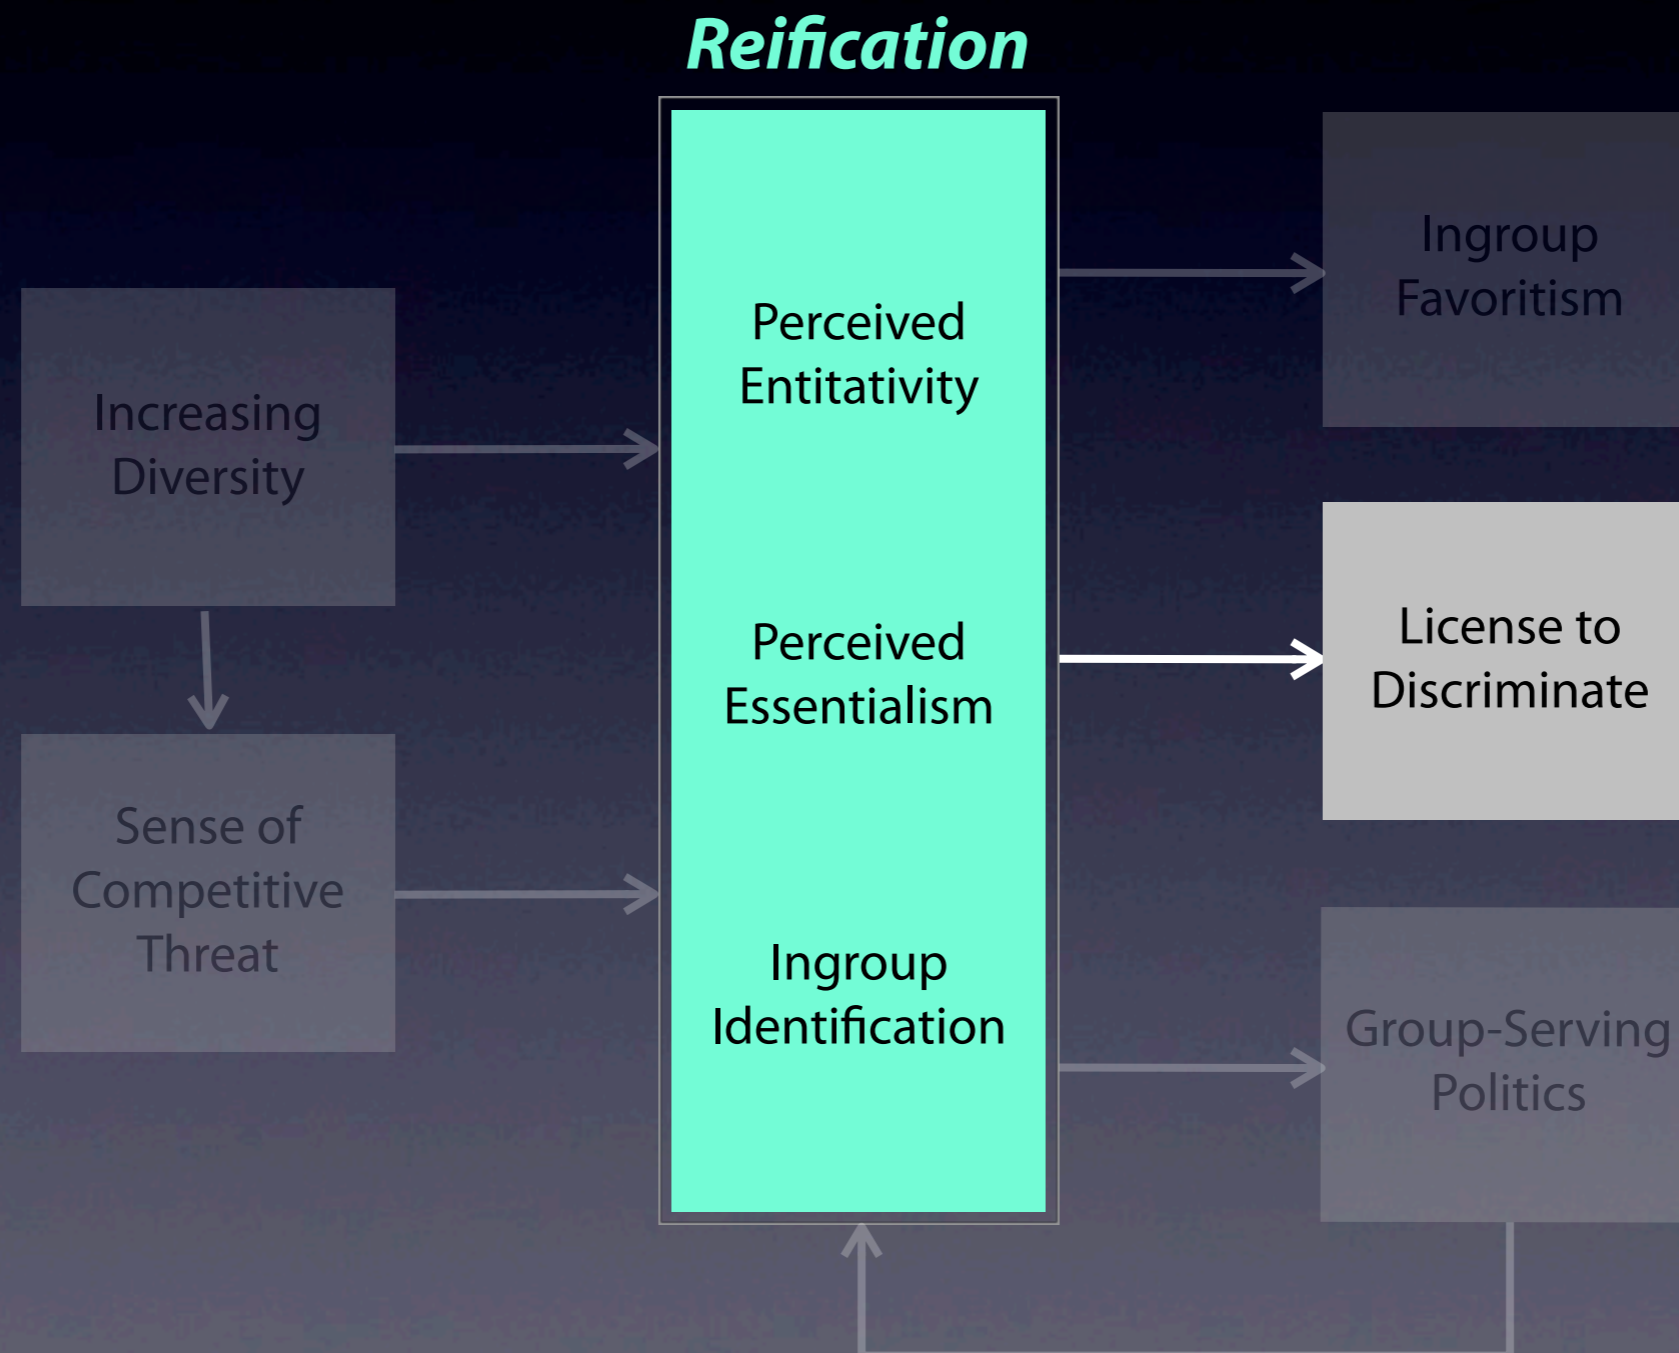

- Knowles and Effron (data)
  - 83 white participants
  - IVs = Perceived entitativity of whites & blacks
  - DVs:
    - Implicit anti-black prejudice (IAT)<sup>1</sup>
    - Explicit anti-black questionnaire<sup>2</sup>
  - License = implicit-explicit correspondence

<sup>1</sup>Greenwald, McGhee, & Schwartz (1998); <sup>2</sup>Katz & Hass (1988)

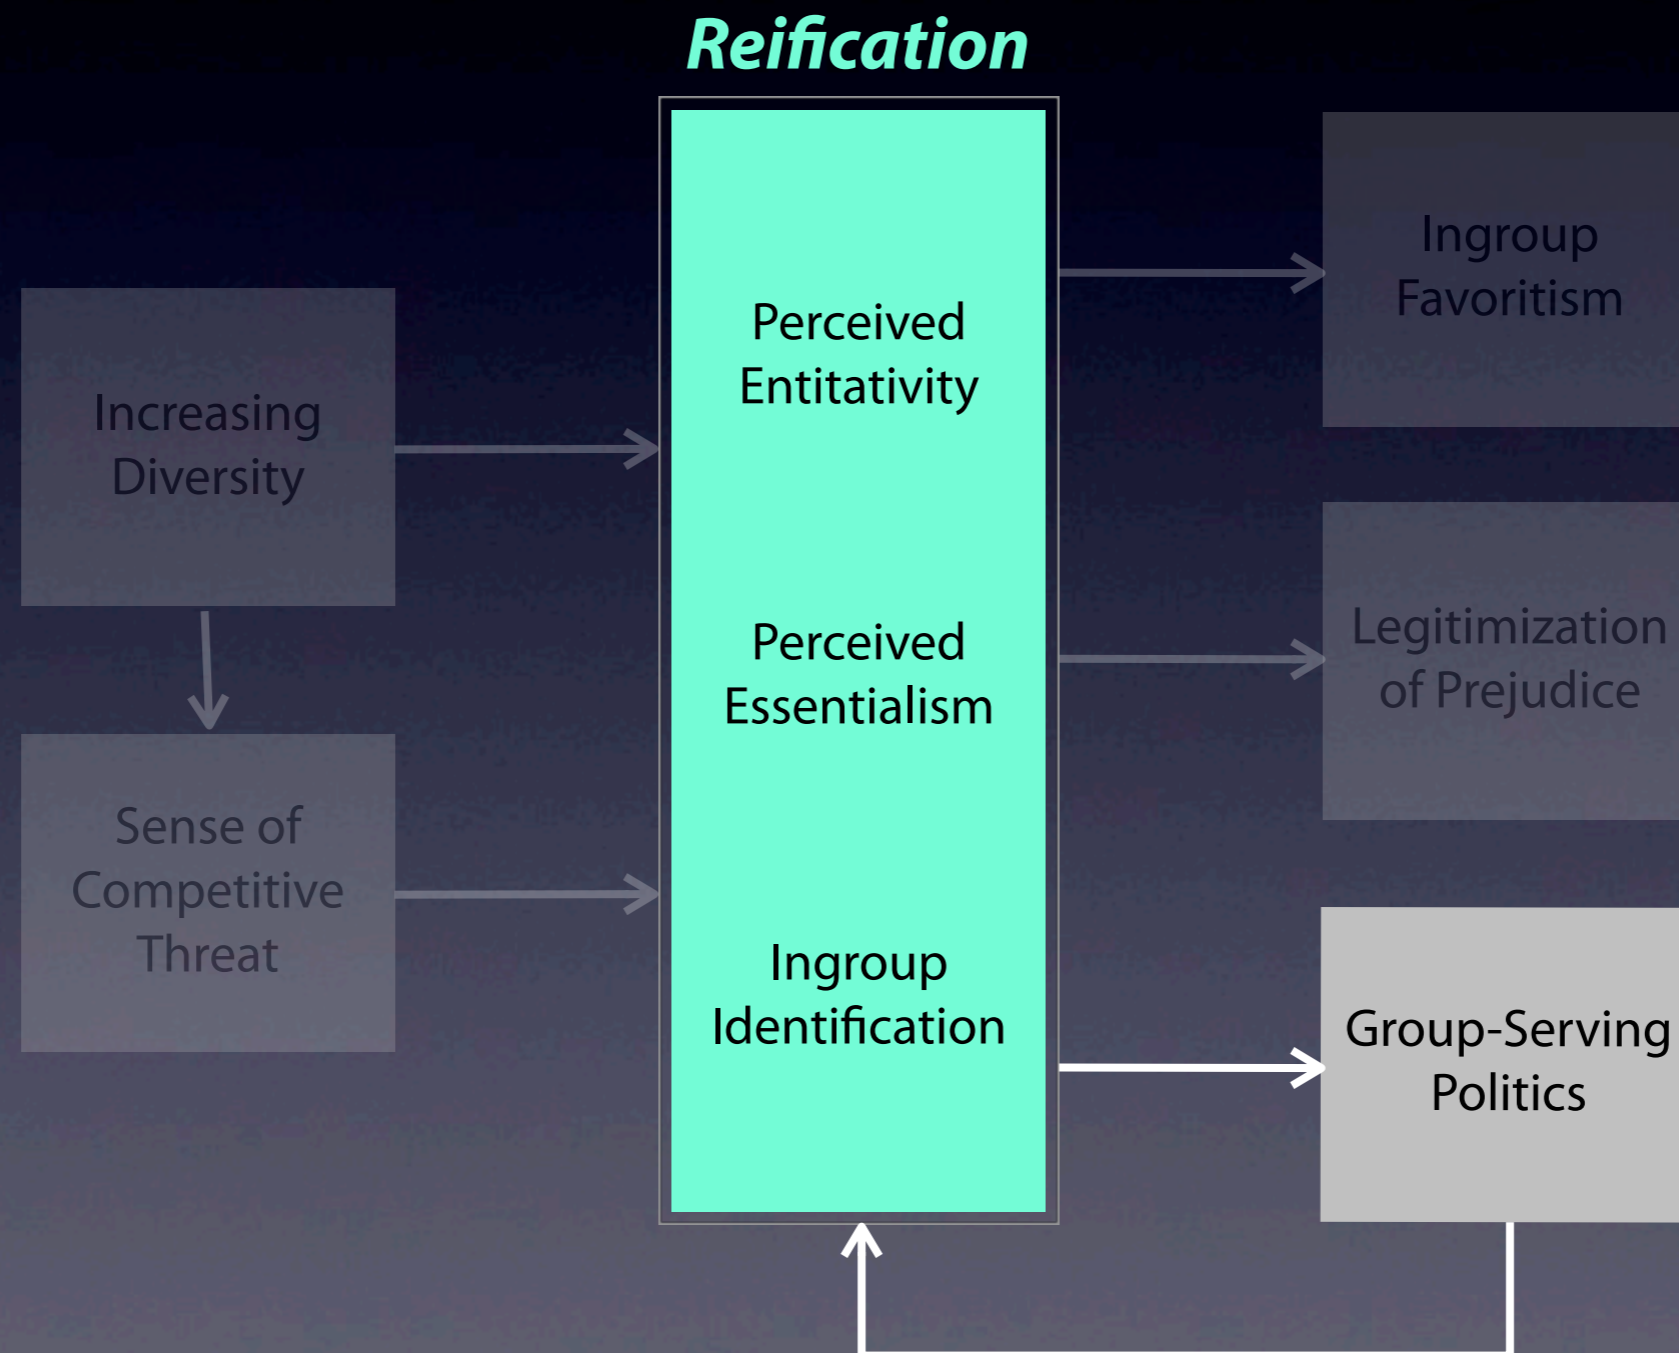

# Implicit-Explicit Correspondence

# Ingroup Reification Model

# Ingroup Reification Model

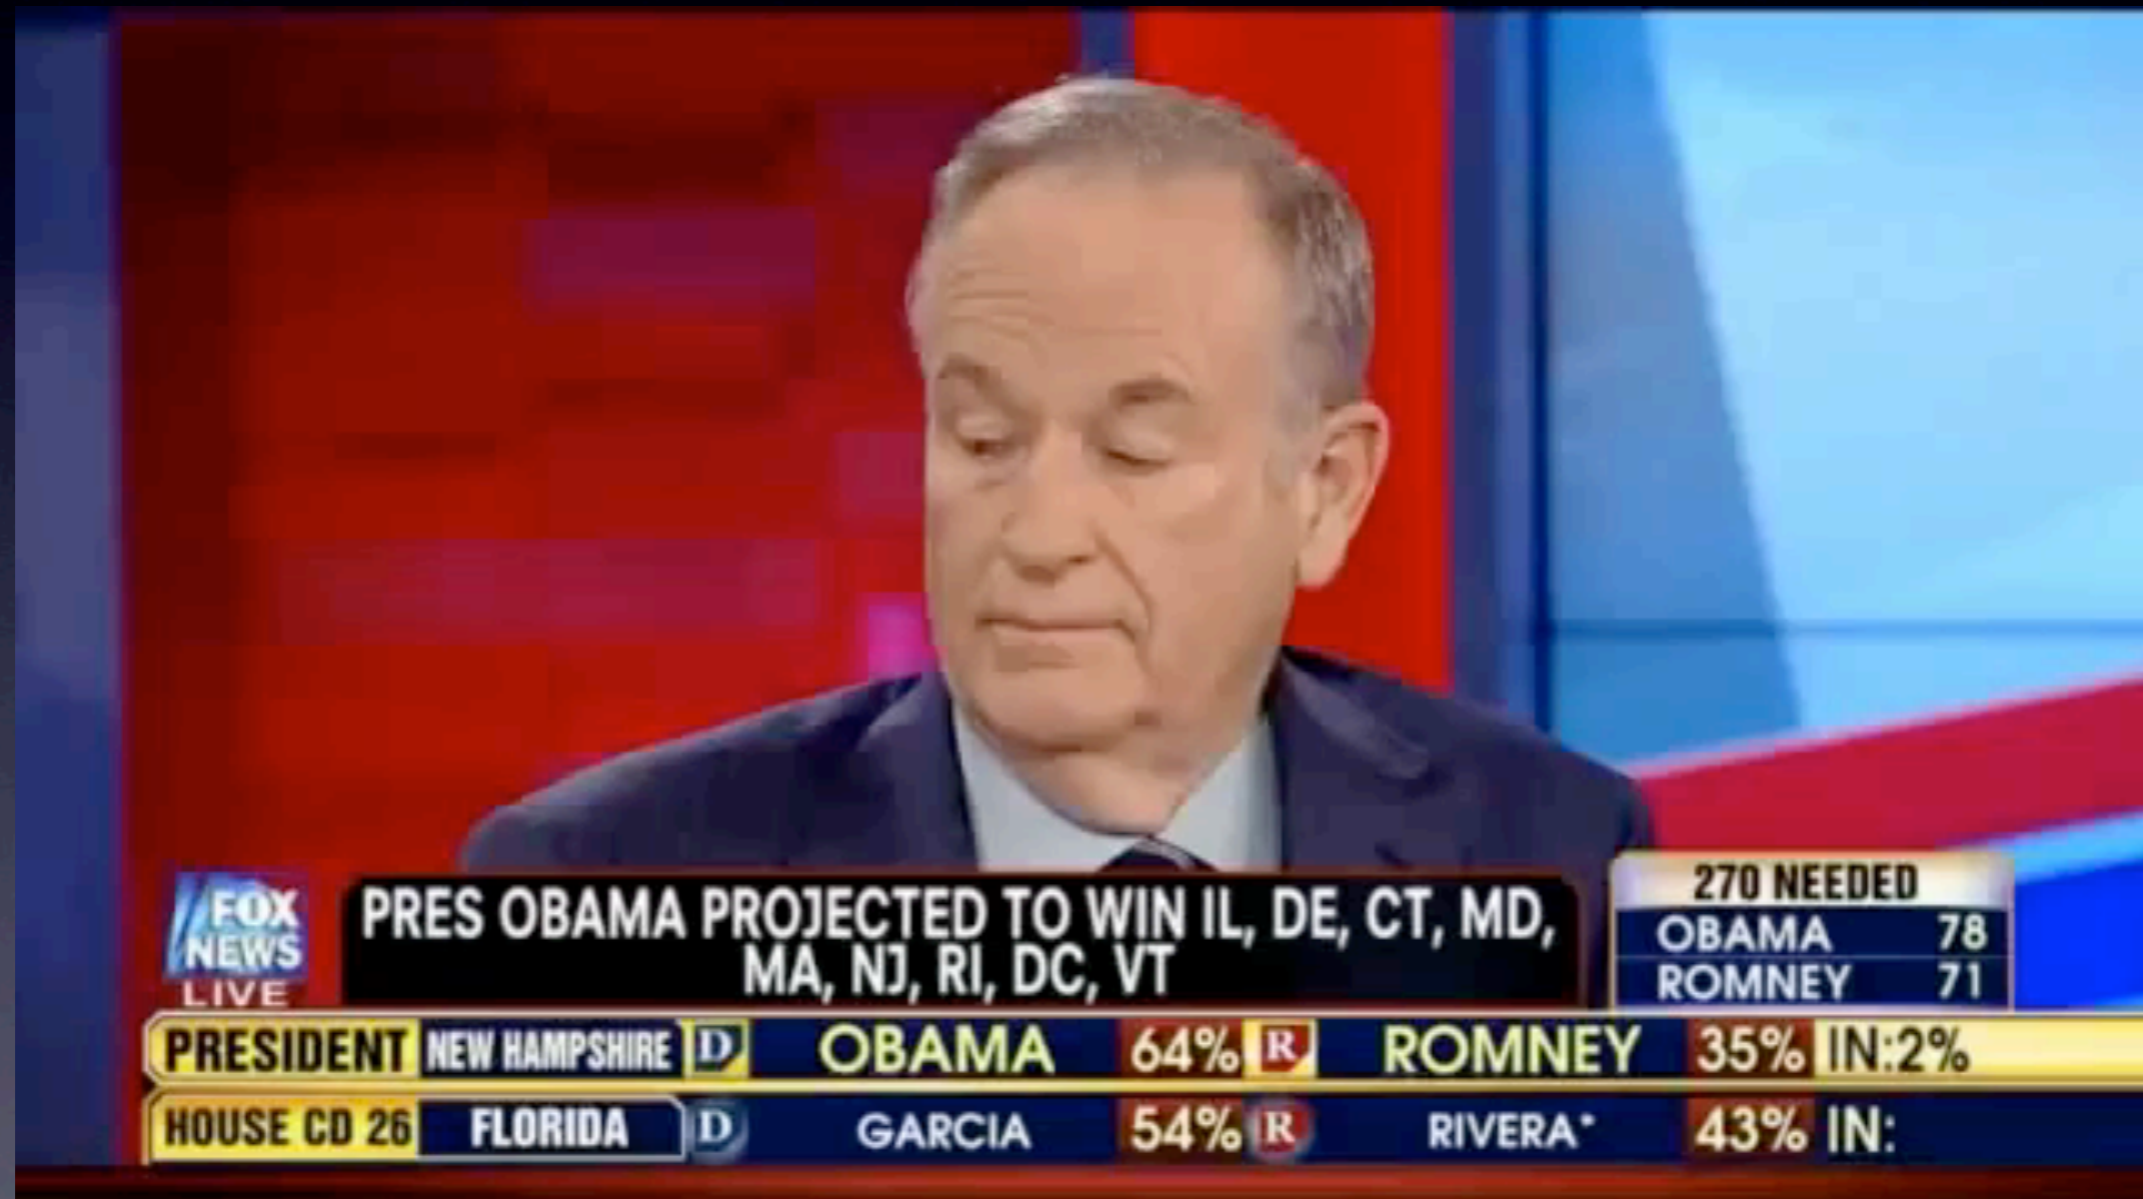

# Group-Serving Politics

- If white reification is weakening colorblind norms, then “white identity politics”<sup>1</sup> may become more pronounced and explicit

<sup>1</sup>Knowles & Marshburn (2010)

# Group-Serving Politics

# White Reification and Politics

- Racialized politics<sup>1</sup>
  - Political choices made with ingroup-serving intent
  - E.g., whites oppose affirmative action because they think it's bad for the ingroup<sup>2</sup>

<sup>1</sup>Sears et al. (2000); <sup>2</sup>Lowery et al. (2006)

# White Reification and Politics

- Political racialization
  - Political affiliations may increase awareness of, and investment in, ingroup interests
  - Elites (O'Reilly) from chosen affiliation inject ingroup racial rhetoric into discourse<sup>1, 2</sup>
  - E.g., membership in fraternities/sororities increased whites' sense of racial victimization<sup>3</sup>

<sup>1</sup>Malka & Lelkes (2010); <sup>2</sup>Sniderman & Bullock (2004); <sup>3</sup>Sidanius, van Laar, Levin, & Sinclair (2004)

# Race and the Tea Party

324 non-Hispanic whites, assessed 3 times:

**Time 1**  
**July, 2010**

- Racial Common Fate
- Tea Party Support

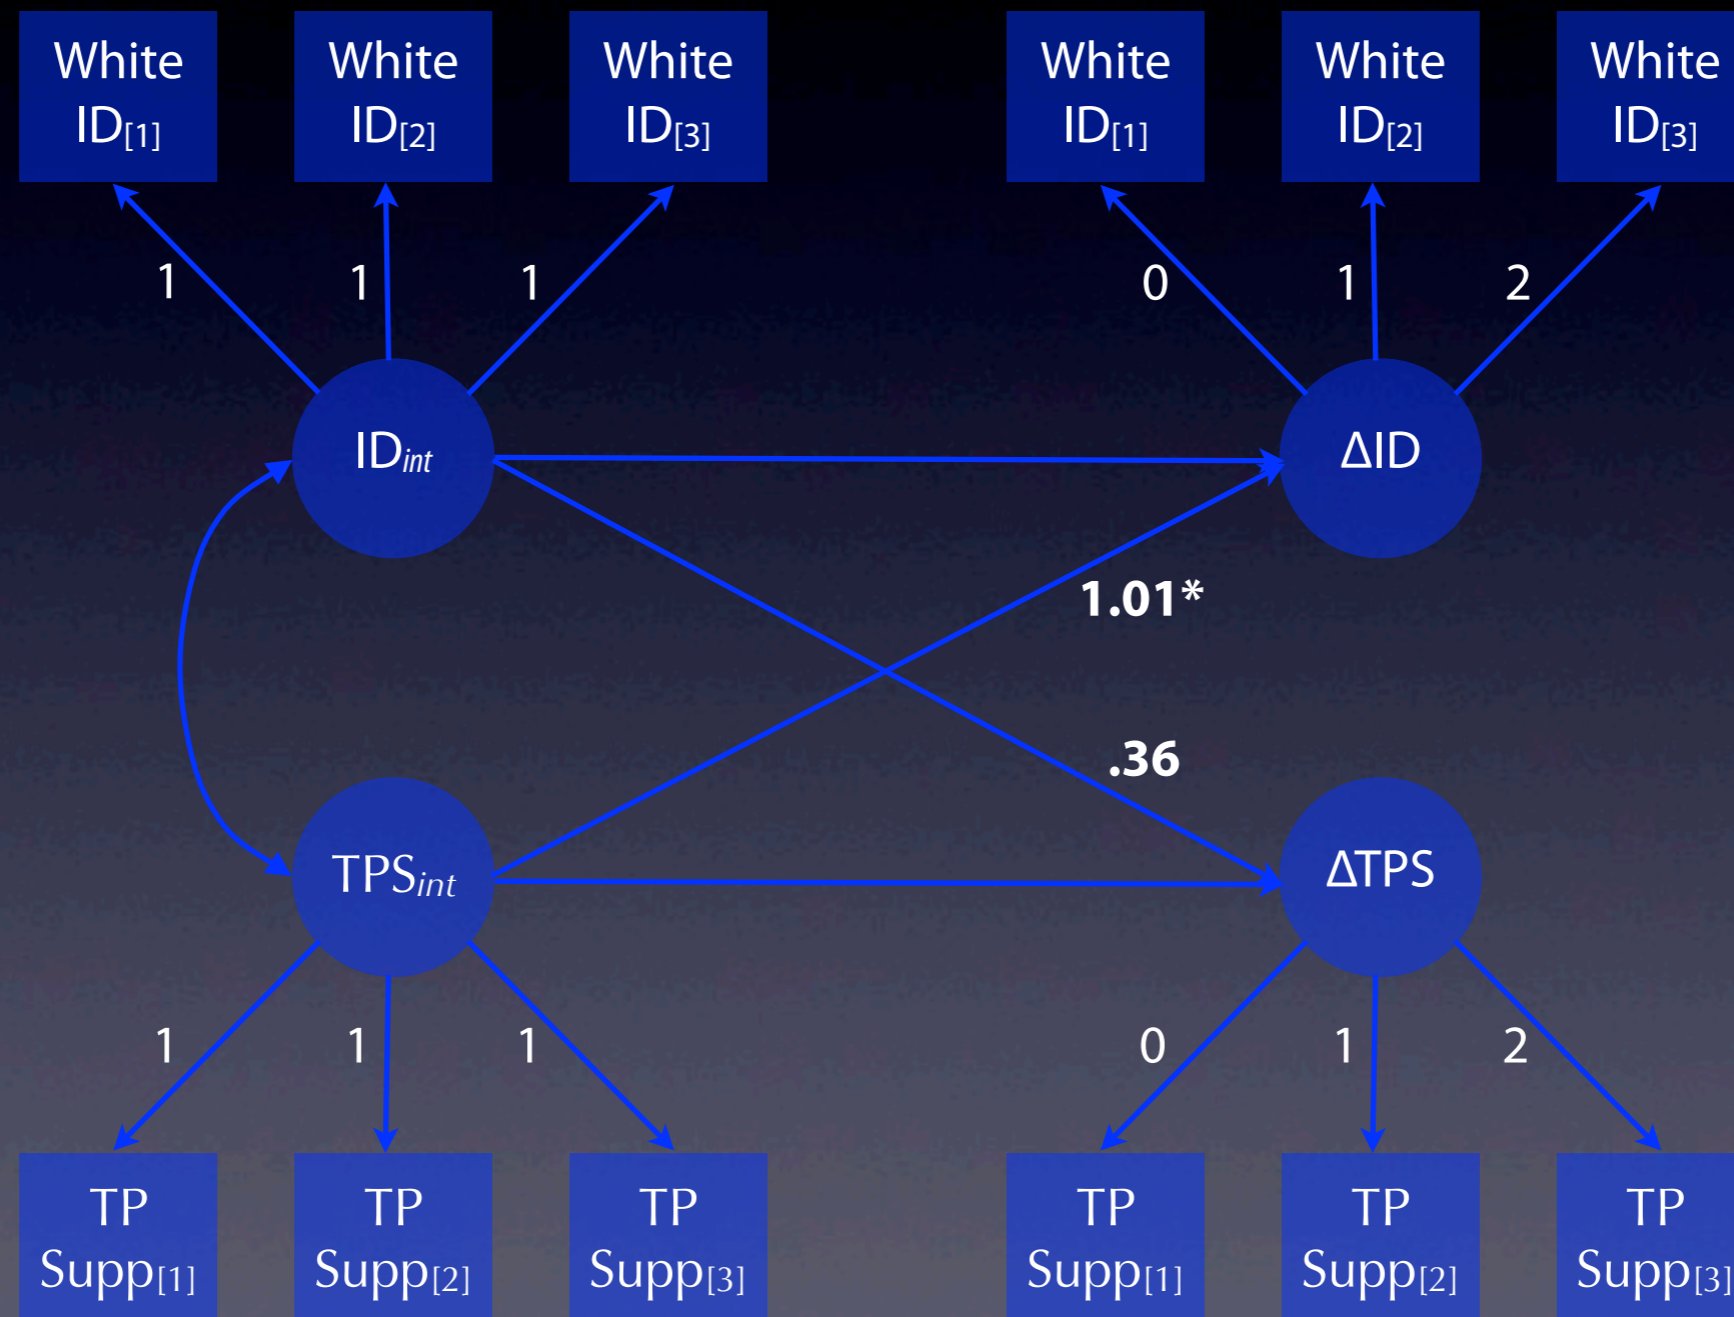

**Time 2**  
**October, 2010**

- Racial Common Fate
- Tea Party Support

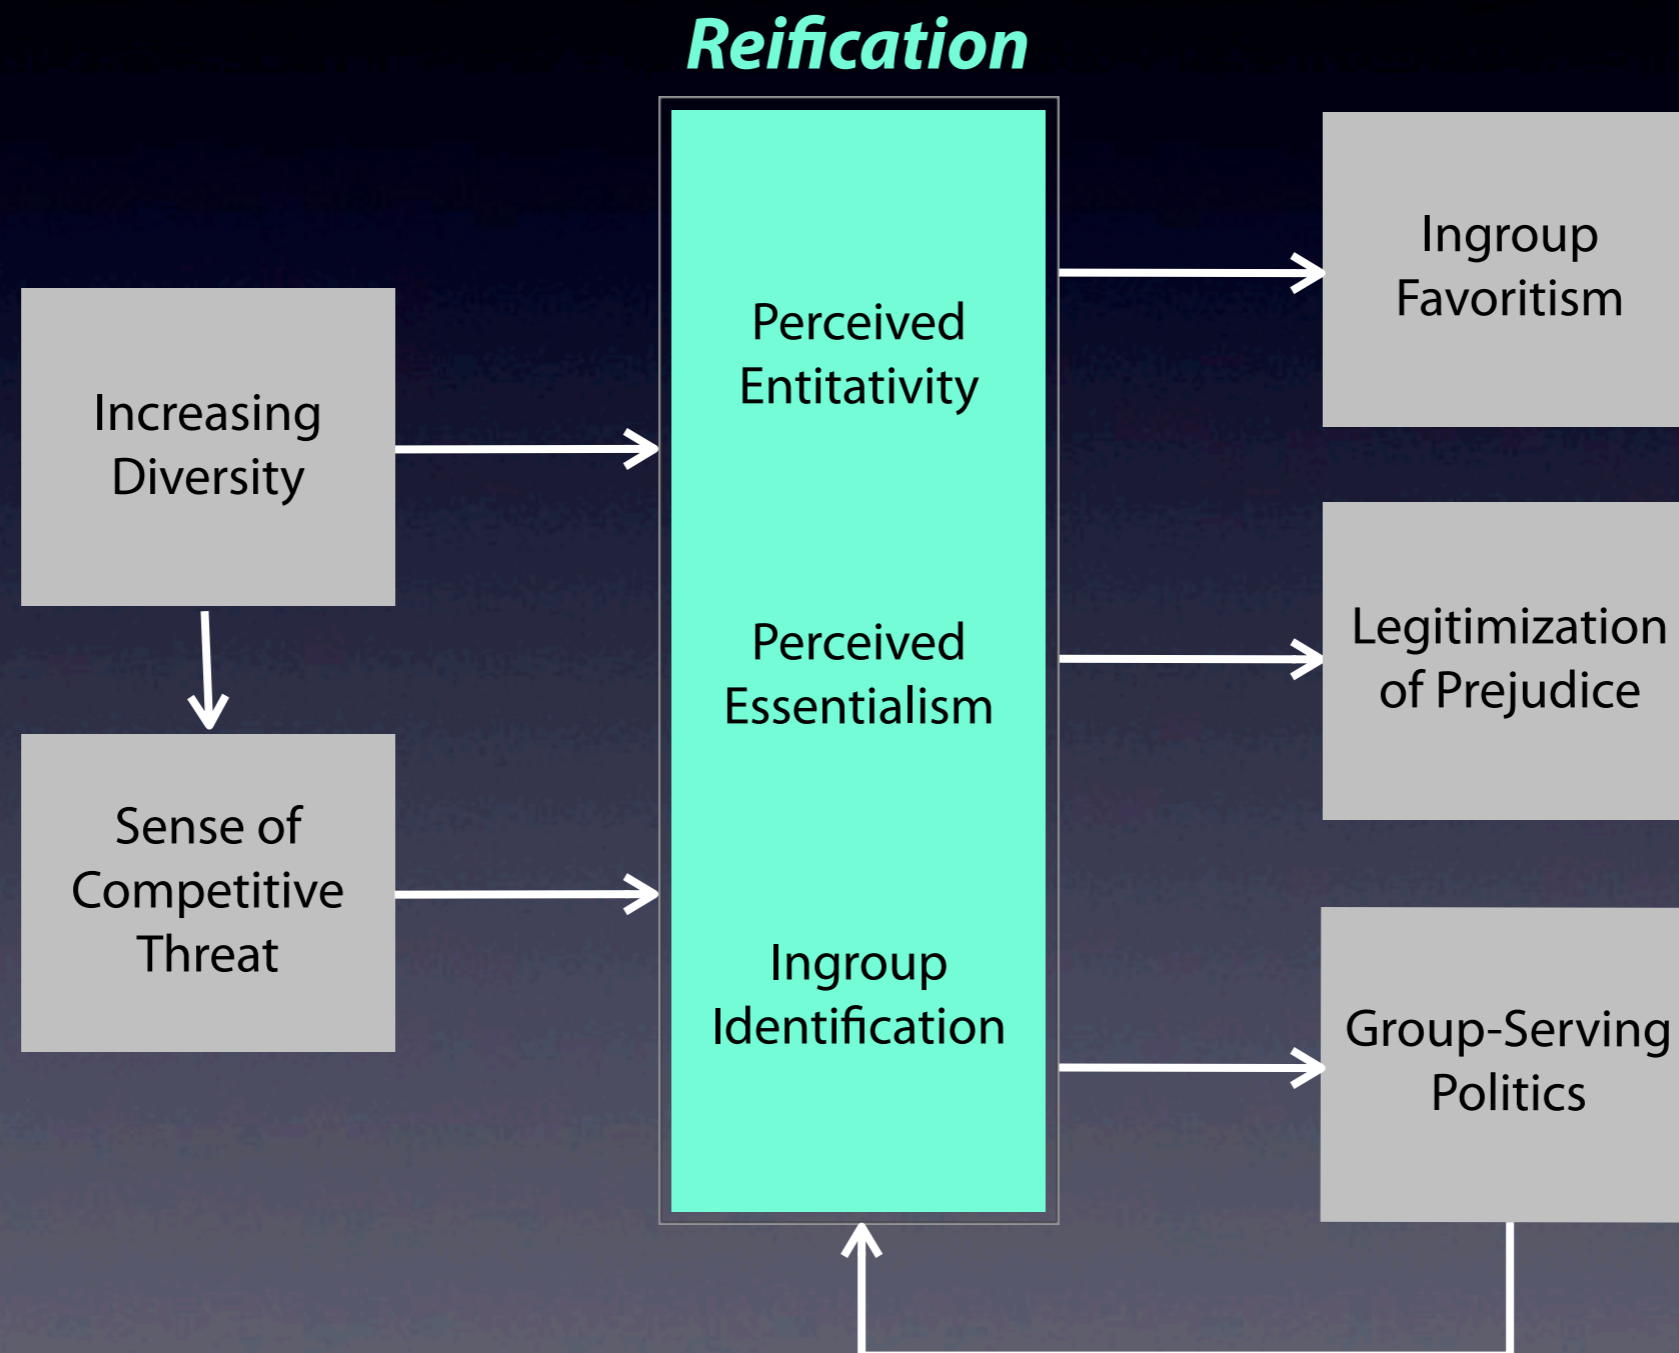

**Time 3**  
**Mid-January, 2011**

- Racial Common Fate
- Tea Party Support

# Precursors of Tea Party Support

# Ingroup Reification Model

# This is Important

- Though destined to become a minority, whites aren't going to lose their hegemonic status anytime soon<sup>1</sup>
- How whites use their outsized voice in social and political life will hinge on how they respond to their smaller and smaller share of the population

<sup>1</sup>Oliver & Shapiro (1995)

# Acknowledgments

- Daniel Effron
- Brian Lowery
- Rebecca Schaumberg
- Elizabeth Shulman

# Testing the Reification Model

- Comprehensive longitudinal study measuring reification (entitativity, essentialism, identification) and intergroup consequences
- Probability sample of white Americans

# Testing the Reification Model

- Nuanced measures of intergroup contact<sup>1</sup>
  - Dissimilarity index
    - Spatial differentiation (vs. overlap) of two groups' home addresses
  - Exposure index
    - Likelihood that a member of group A shares a space with a member of group B

<sup>1</sup>Massey & Denton (1988)

# Dissimilarity and Exposure

- **Dissimilarity**

$$D_{county} = \frac{1}{2} \sum_{i=1}^N \left| \frac{w_i}{W_{county}} - \frac{nw_i}{NW_{county}} \right|$$

% of whites or non-whites that would have to be to achieve “evenness” —**residential segregation**

- **Exposure**

$$I_{county} = \sum_{i=1}^N \left( \frac{w_i}{W_{county}} \right) \left( \frac{nw_i}{t_i} \right)$$

Chance a random white shares an area with a non-white person—**experiential segregation**
